

Module 11: Session Hijacking

Scenario

A session hijacking attack refers to the exploitation of a session token-generation mechanism or token security controls that enables an attacker to establish an unauthorized connection with a target server. The attacker guesses or steals a valid session ID (which identifies authenticated users) and uses it to establish a session with the server.

As an ethical hacker or penetration tester, you should understand different session hijacking concepts, how attackers perform application- and network-level session hijacking, and the various tools used to launch this kind of attack. You should also be able to implement security measures at both the application and network levels to protect your network from session hijacking. Application-level hijacking involves gaining control over the Hypertext Transfer Protocol (HTTP) user session by obtaining the session IDs. Network-level hijacking is prevented by packet encryption, which can be achieved with protocols such as IPsec, SSL, and SSH.

Objective

The objective of the lab is to perform session hijacking and other tasks that include, but are not limited to:

- Hijack a session by intercepting traffic between server and client
- Steal a user session ID by intercepting traffic
- Detect session hijacking attacks

Overview of Session Hijacking

Session hijacking can be either active or passive, depending on the degree of involvement of the attacker:

- **Active session hijacking:** An attacker finds an active session and takes it over
- **Passive session hijacking:** An attacker hijacks a session, and, instead of taking over, monitors and records all the traffic in that session

Lab Tasks

Ethical hackers or penetration testers use numerous tools and techniques to perform session hijacking on the target systems.

Recommended labs that will assist you in learning various session hijacking techniques include:

1. Perform session hijacking
 - Hijack a session using Zed Attack Proxy (ZAP)
 - Intercept HTTP traffic using bettercap
 - Intercept HTTP traffic using Hetty
2. Detect session hijacking
 - Detect session hijacking using Wireshark

Lab 1: Perform Session Hijacking

Lab Scenario

Session hijacking allows an attacker to take over an active session by bypassing the authentication process. It involves stealing or guessing a victim's valid session ID, which the server uses to identify authenticated users, and using it to establish a connection with the server. The server responds to the attacker's requests as though it were communicating with an authenticated user, after which the attacker is able to perform any action on that system.

Attackers can use session hijacking to launch various kinds of attacks such as man-in-the-middle (MITM) and Denial-of-Service (DoS) attacks. A MITM attack occurs when an attacker places himself/herself between the authorized client and the server to intercept information flowing in either direction. A DoS attack happens when attackers sniff sensitive information and use it to make host or network resource unavailable to users, usually by flooding the target with requests until the system is overloaded.

As a professional ethical hacker or penetration tester, you must possess the required knowledge to hijack sessions in order to test the systems in the target network.

The labs in this exercise demonstrate how to hijack an active session between two endpoints.

Lab Objectives

- Hijack a session using Zed Attack Proxy (ZAP)
- Intercept HTTP traffic using bettercap
- Intercept HTTP traffic using Hetty

Overview of Session Hijacking

Session hijacking can be divided into three broad phases:

- **Tracking the Connection:** The attacker uses a network sniffer to track a victim and host, or uses a tool such as Nmap to scan the network for a target with a TCP sequence that is easy to predict
- **Desynchronizing the Connection:** A desynchronized state occurs when a connection between the target and host has been established, or is stable with no data transmission, or when the server's sequence number is not equal to the client's acknowledgment number (or vice versa)
- **Injecting the Attacker's Packet:** Once the attacker has interrupted the connection between the server and target, they can either inject data into the network or actively participate as the man-in-the-middle, passing data between the target and server, while reading and injecting data at will

Task 1: Hijack a Session using Zed Attack Proxy (ZAP)

Zed Attack Proxy (ZAP) is an integrated penetration testing tool for finding vulnerabilities in web applications. It offers automated scanners as well as a set of tools that allow you to find security vulnerabilities manually. It is designed to be used by people with a wide range of security experience, and as such is ideal for developers and functional testers who are new to penetration testing.

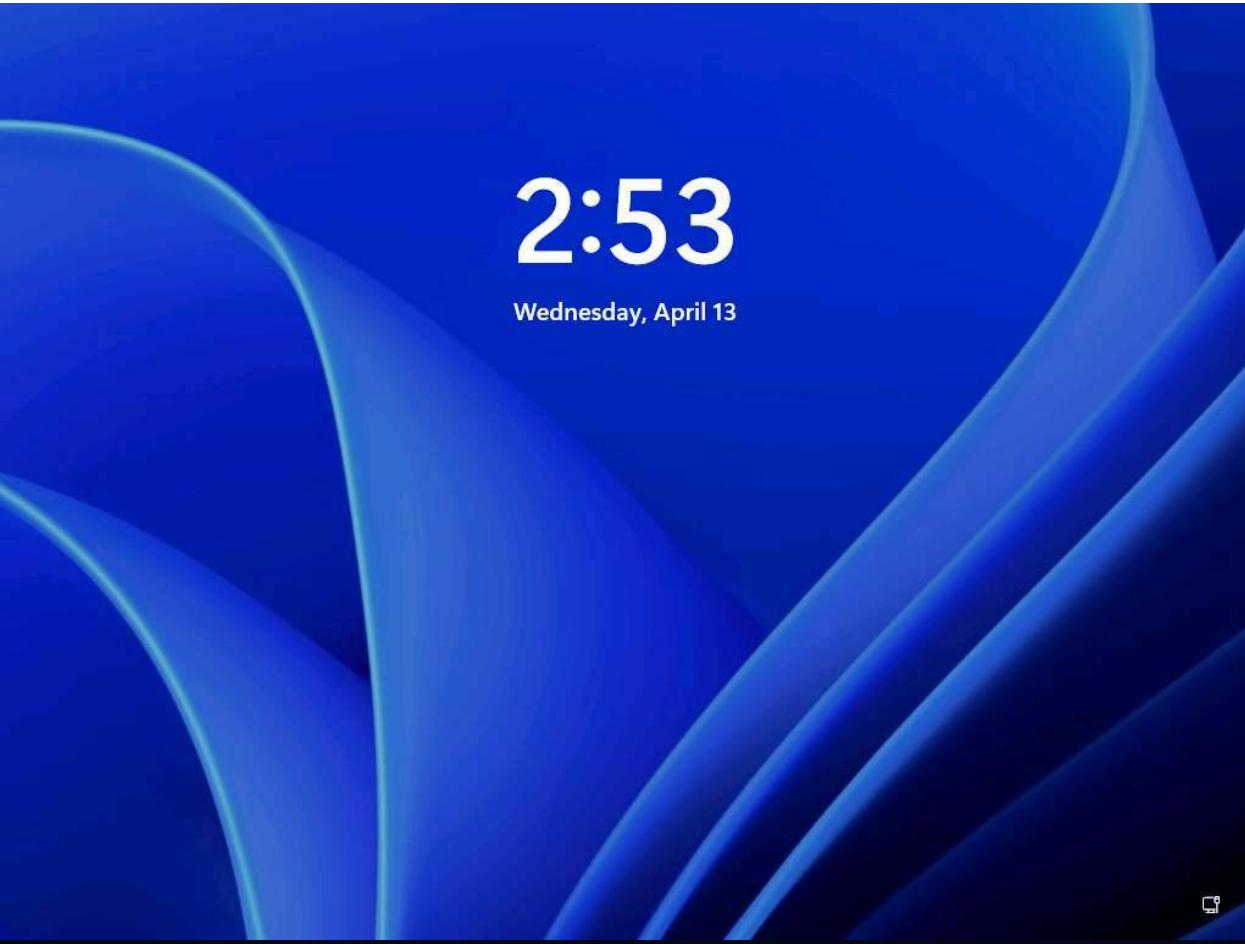

ZAP allows you to see all the requests you make to a web app and all the responses you receive from it. Among other things, it allows you to see AJAX calls that may not otherwise be outright visible. You can also set breakpoints, which allow you to change the requests and responses in real-time.

Here, we will hijack a session using ZAP. You will learn how to intercept the traffic of victims' machines with a proxy and how to view all the requests and responses from them.

Note: Before starting this task, we need to configure the proxy settings in the victim's machine, which in this task will be the **Windows 11** machine.

1. Click **CEHv12 Windows 11** to switch to the **Windows 11** machine, click **Ctrl+Alt+Del**.

2:53

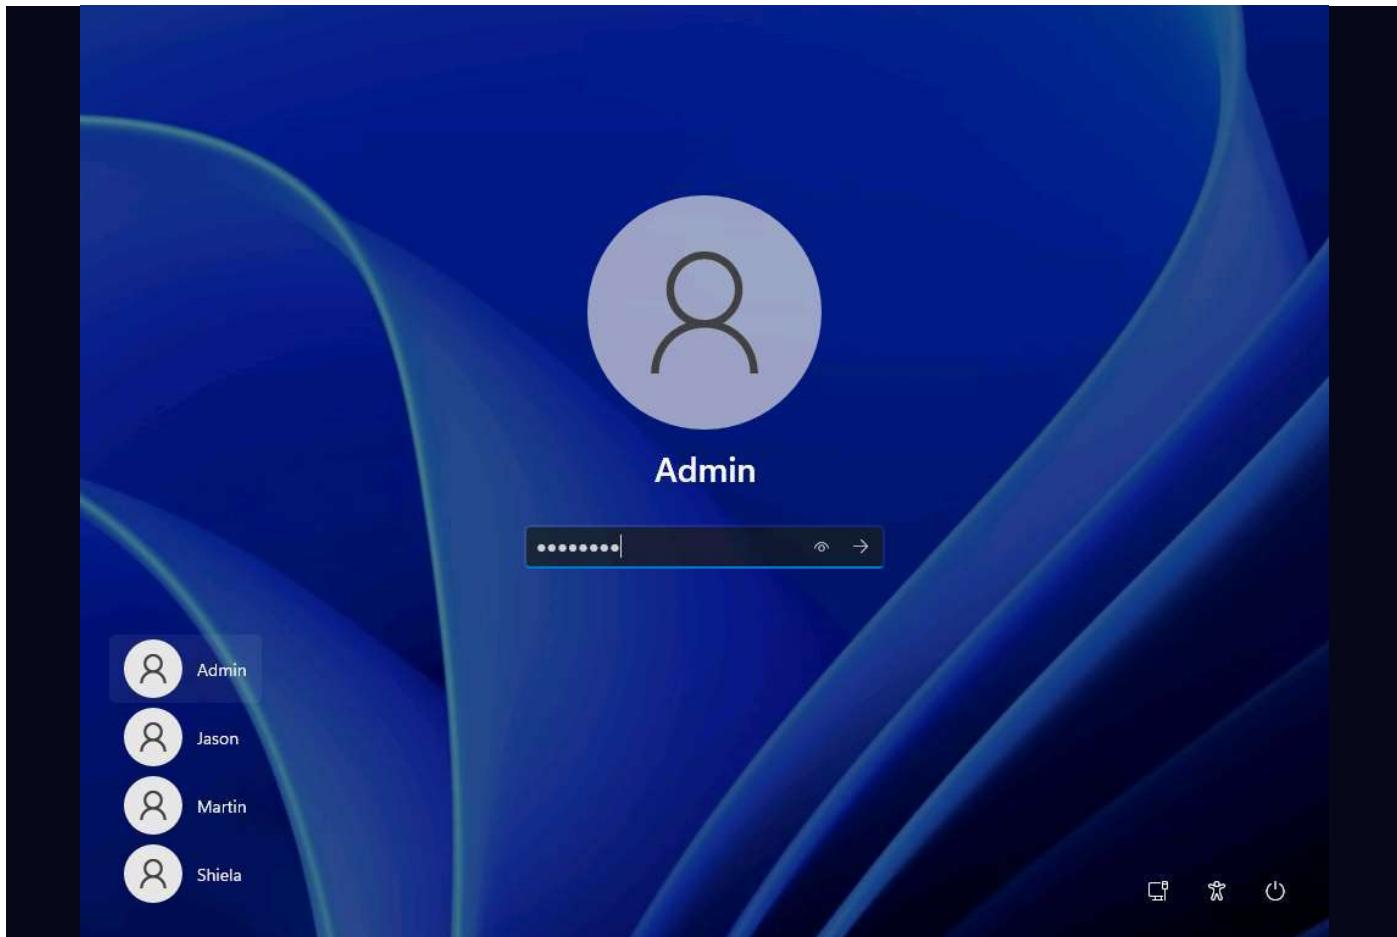

Wednesday, April 13

2. By default, **Admin** user profile is selected, type **Pa\$\$w0rd** in the Password field and press **Enter** to login.

Note: If **Welcome to Windows** wizard appears, click Continue. In the **Sign in with Microsoft** wizard click **Cancel** to continue.

Note: Networks screen appears, click **Yes** to allow your PC to be discoverable by other PCs and devices on the network.

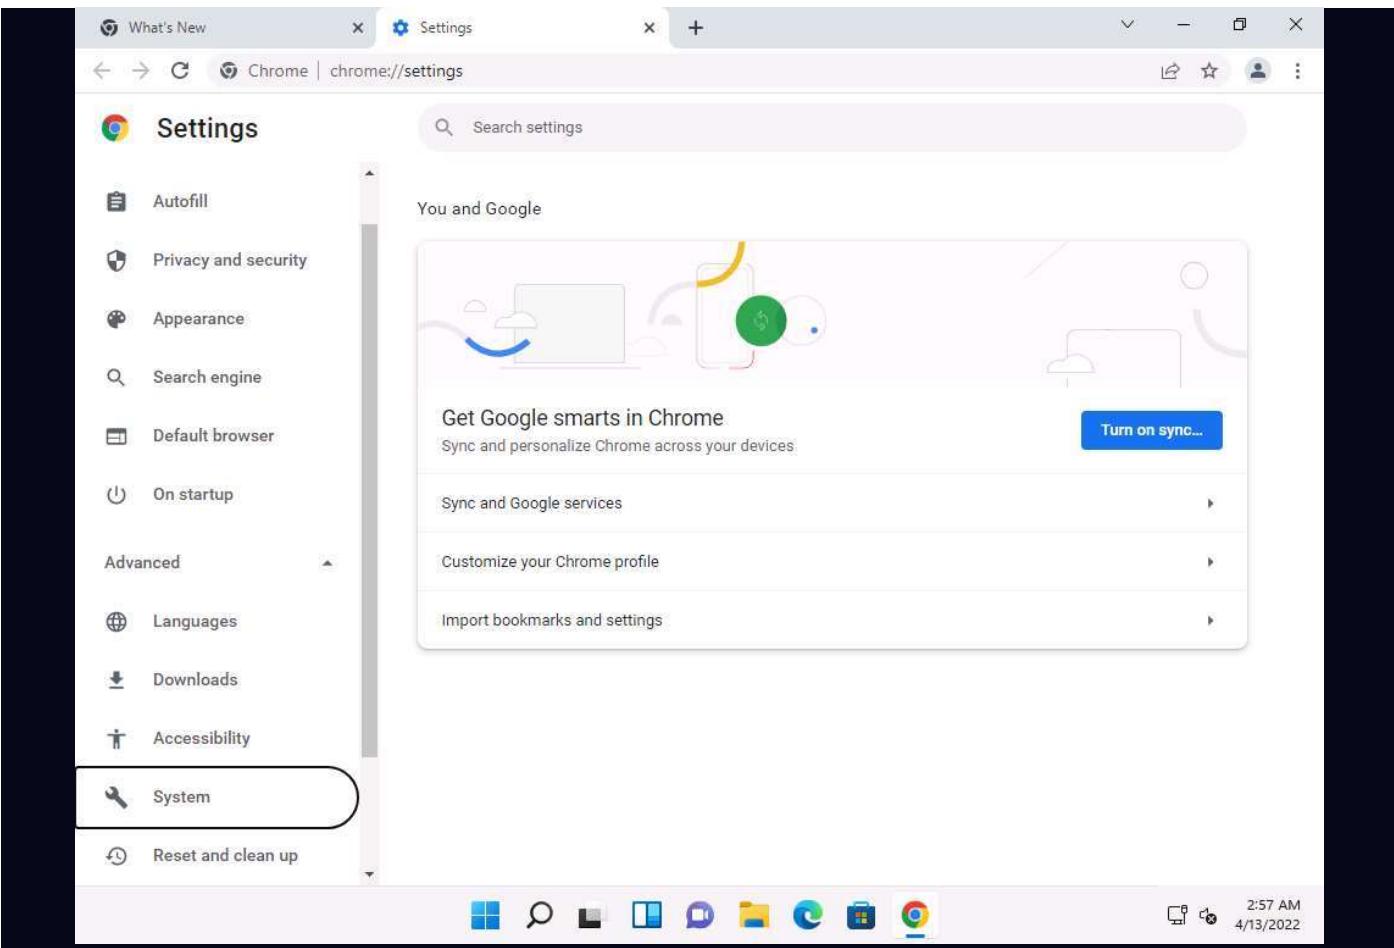

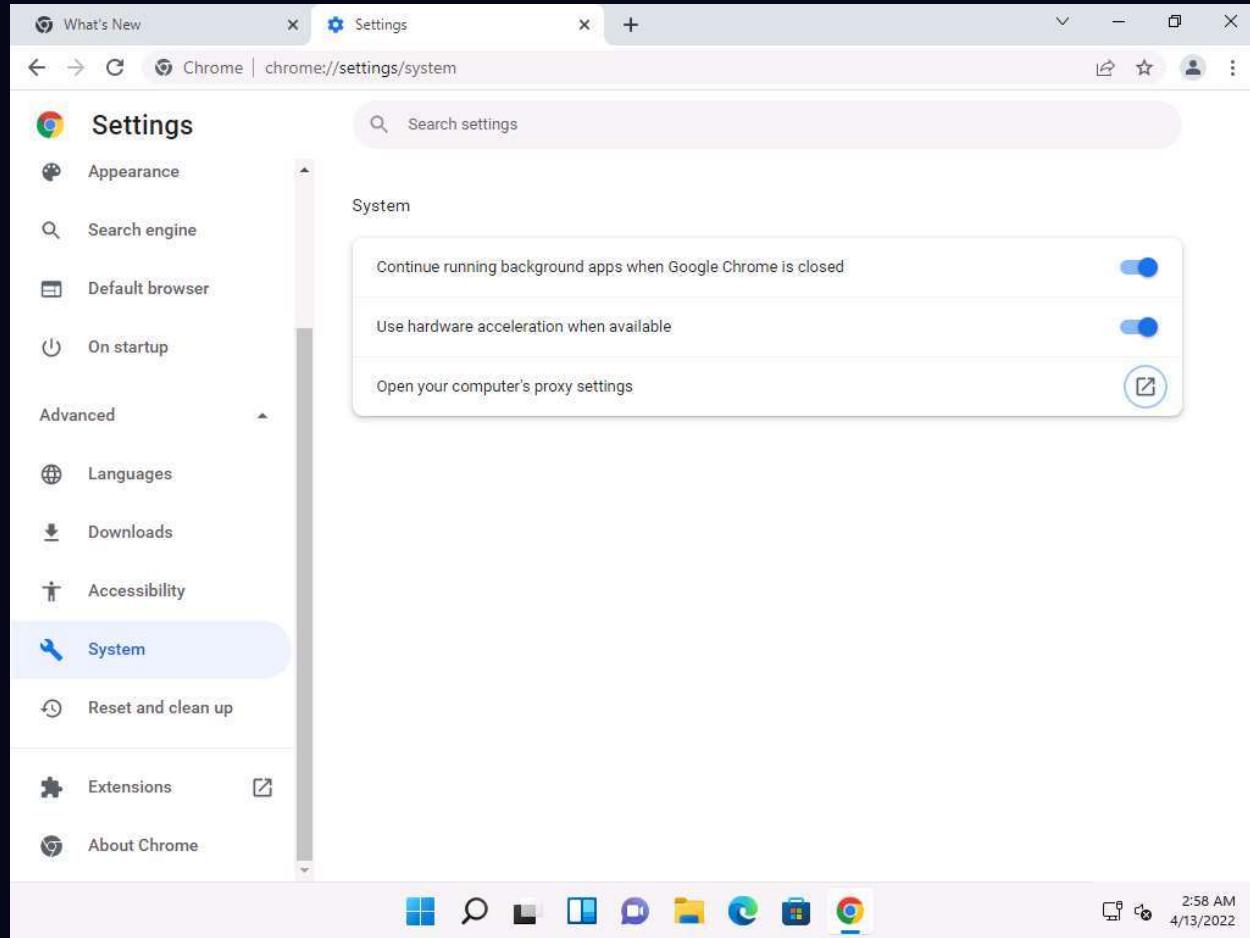

3. Open any web browser (here, **Google Chrome**), click the **Customize and control Google Chrome** icon, and select **Settings** from the context menu.

A screenshot of a Google Chrome window. The title bar says "What's New" and the address bar says "Chrome | chrome://whats-new". The main content area displays the text "Your Chrome is up to date" with a green checkmark icon. Below it, a large heading reads "What's new in Chrome". A sub-section below the heading says "Welcome to the 100th release of Chrome. Check out a few features that can help you stay safe online." At the bottom of the page is the Google Chrome logo. On the right side of the screen, a context menu is open, listing options like "New tab", "History", "Zoom", "Print...", "Settings" (which is highlighted in pink), "Help", and "Exit". The menu also includes keyboard shortcuts for some items. The taskbar at the bottom of the screen shows various pinned icons, and the system tray indicates the date and time as "2:55 AM 4/13/2022".

4. On the **Settings** page, scroll down, expand the **Advanced** settings and select **System** option from the left pane.

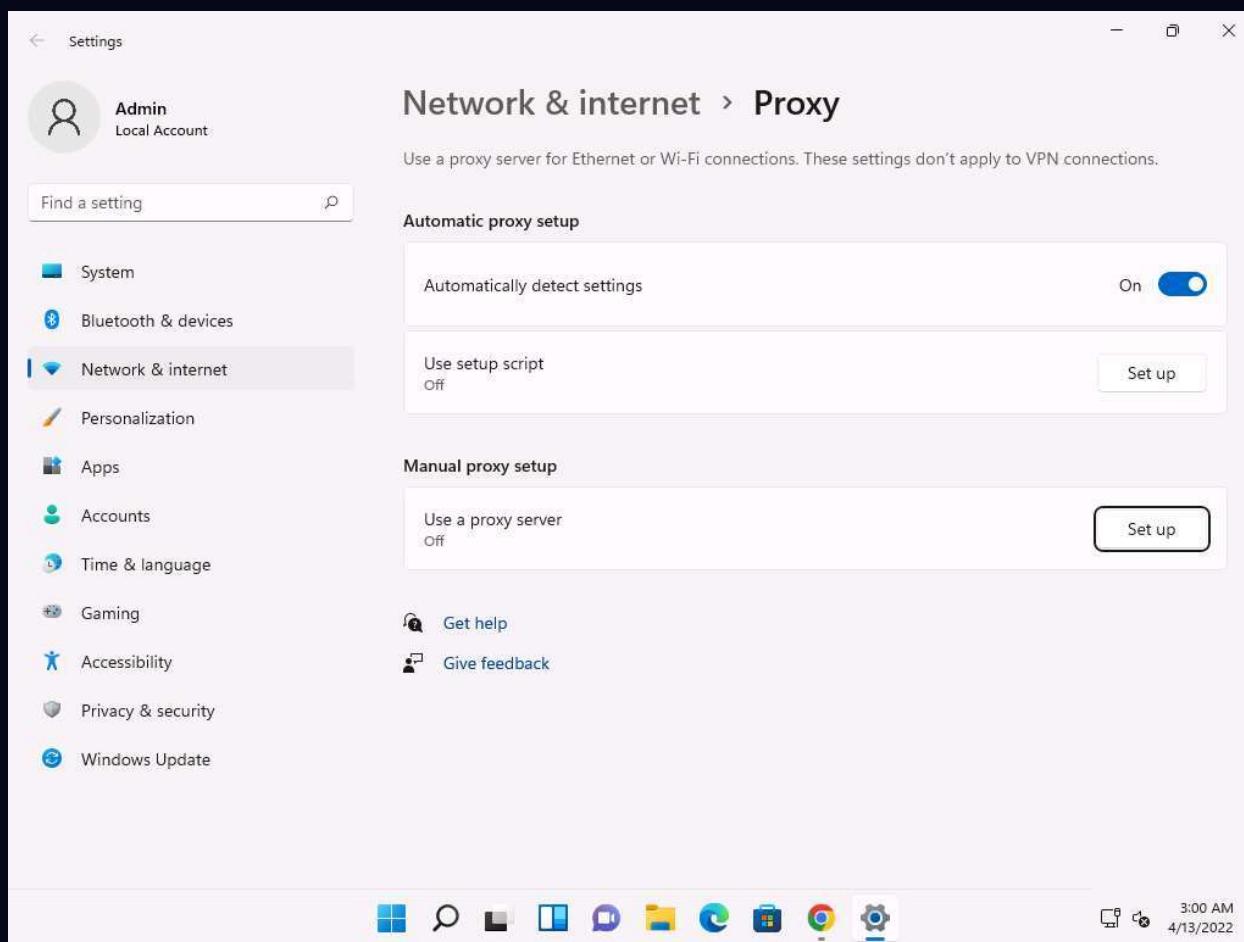

5. **System** page appears and click **Open your computer's proxy settings** to configure a proxy.

6. A **Settings** window opens, with the **Proxy** settings in the right pane.

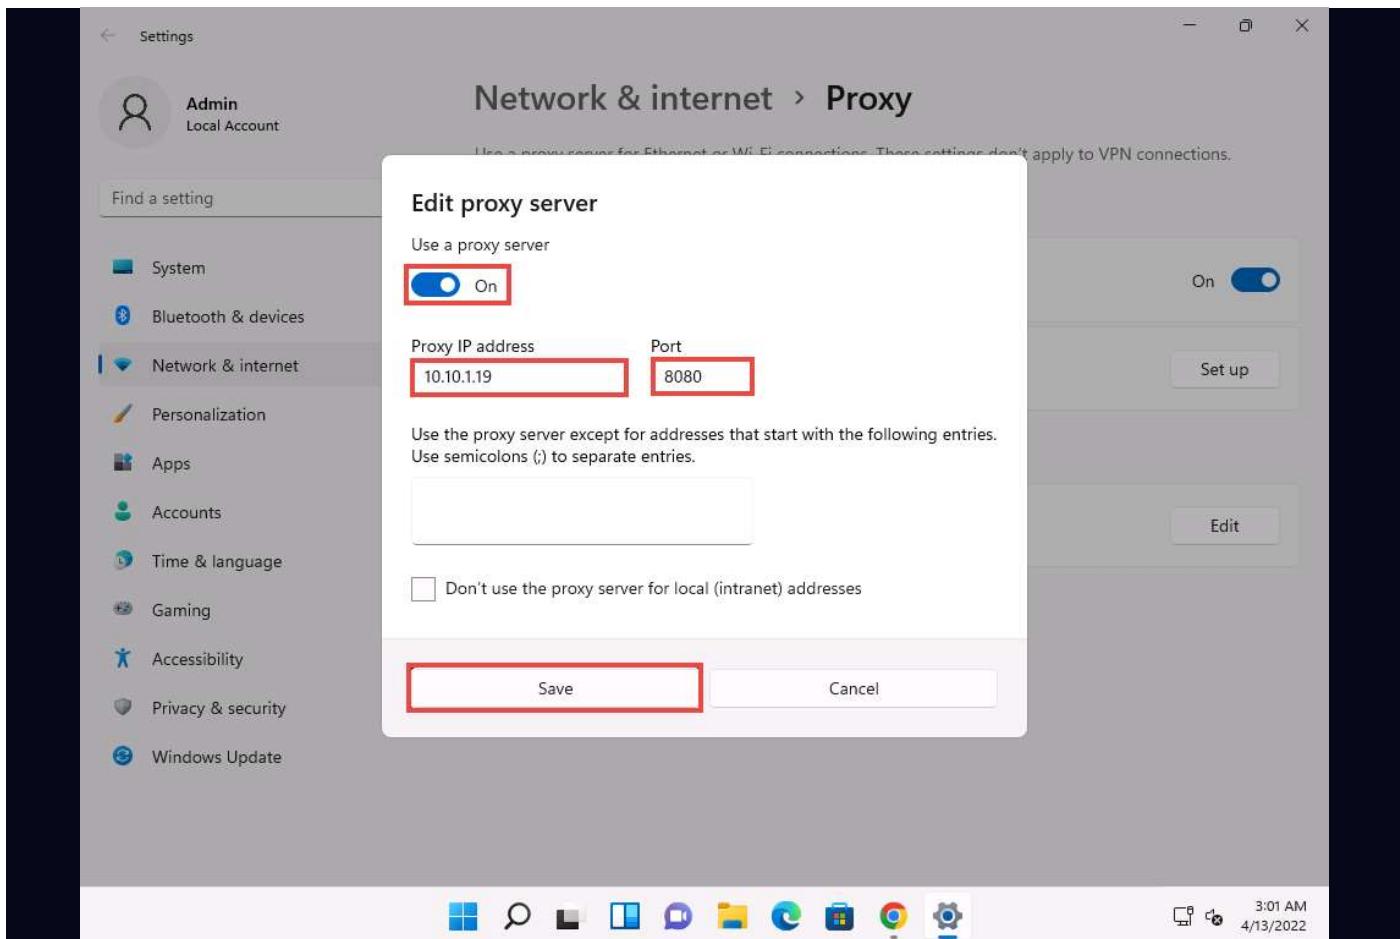

7. Click **Set up** button under **Manual proxy setup** section.

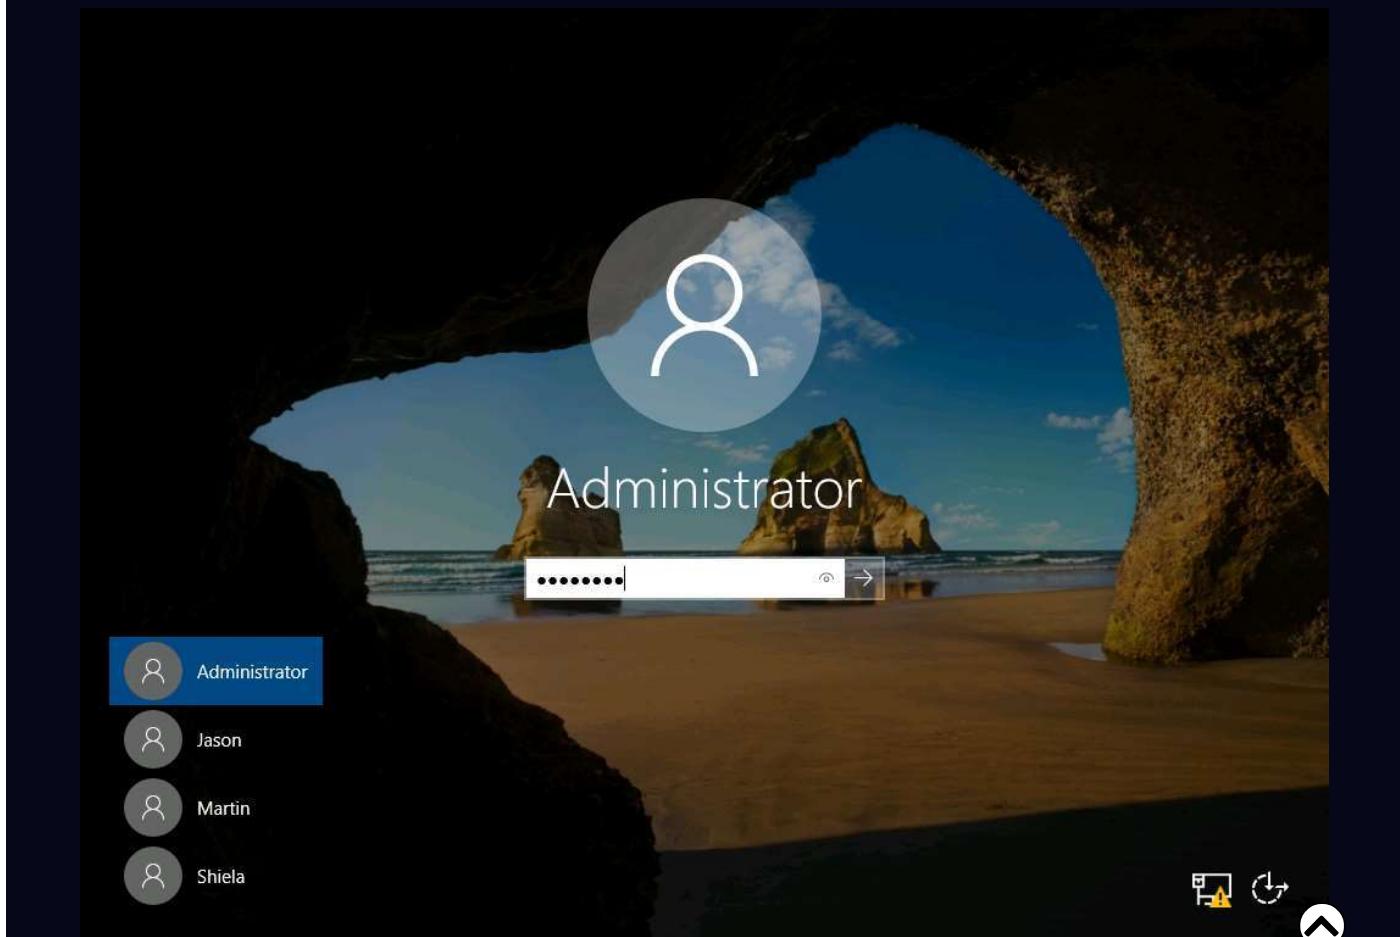

8. **Edit proxy server** window appears, make the following changes:

- o Under the **Use a proxy server** option, click the **Off** button to switch it **On**.
- o In the **Proxy IP address** field, type **10.10.1.19** (the IP address of the attacker's machine).
- o In the **Port** field, type **8080**.
- o Click **Save**.

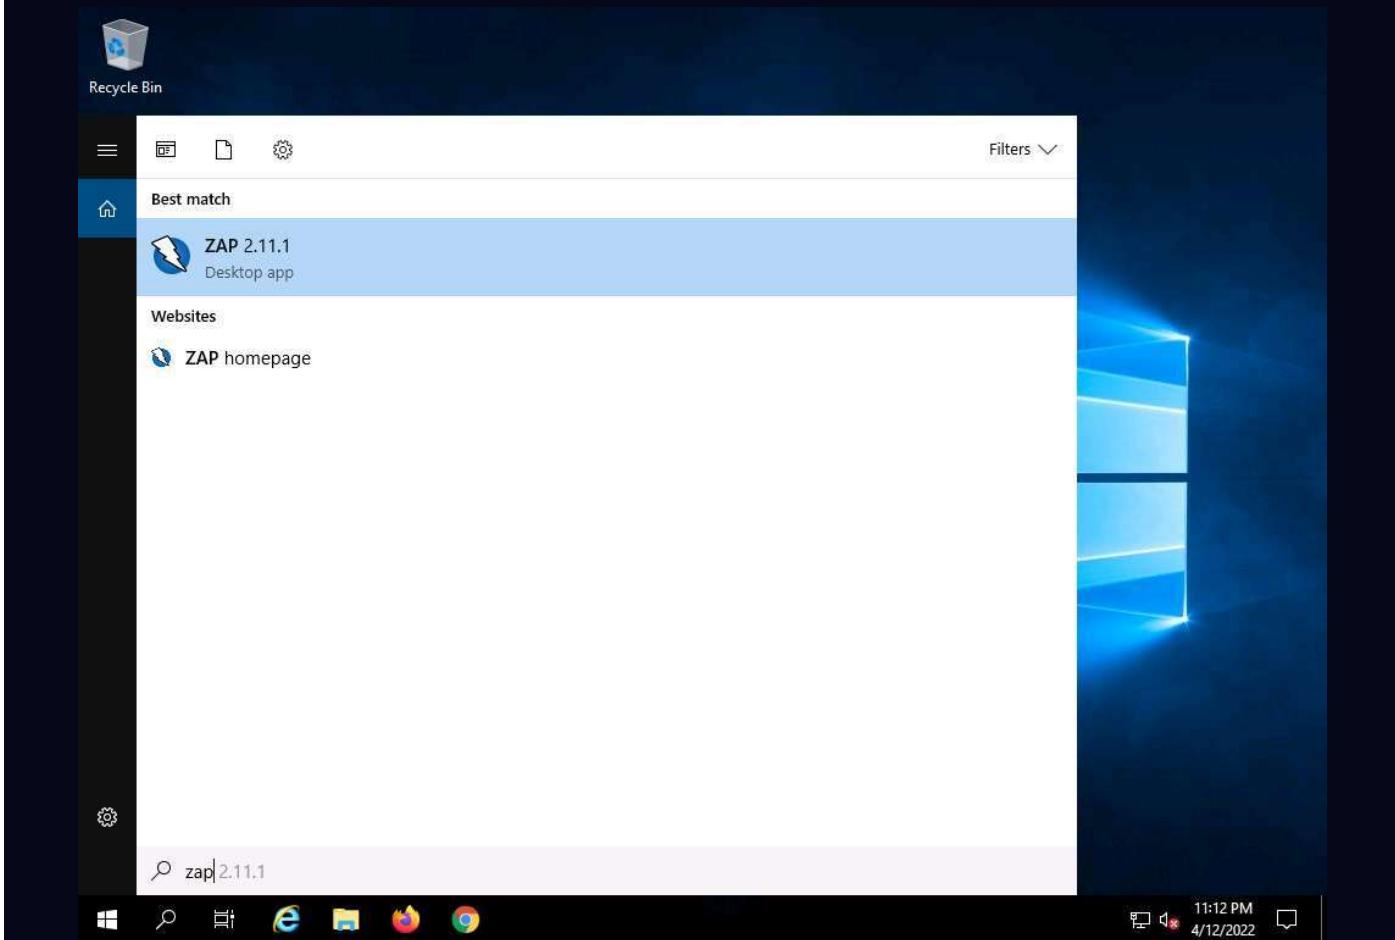

9. After saving, close the **Settings** and browser windows. You have now configured the proxy settings of the victim's machine.

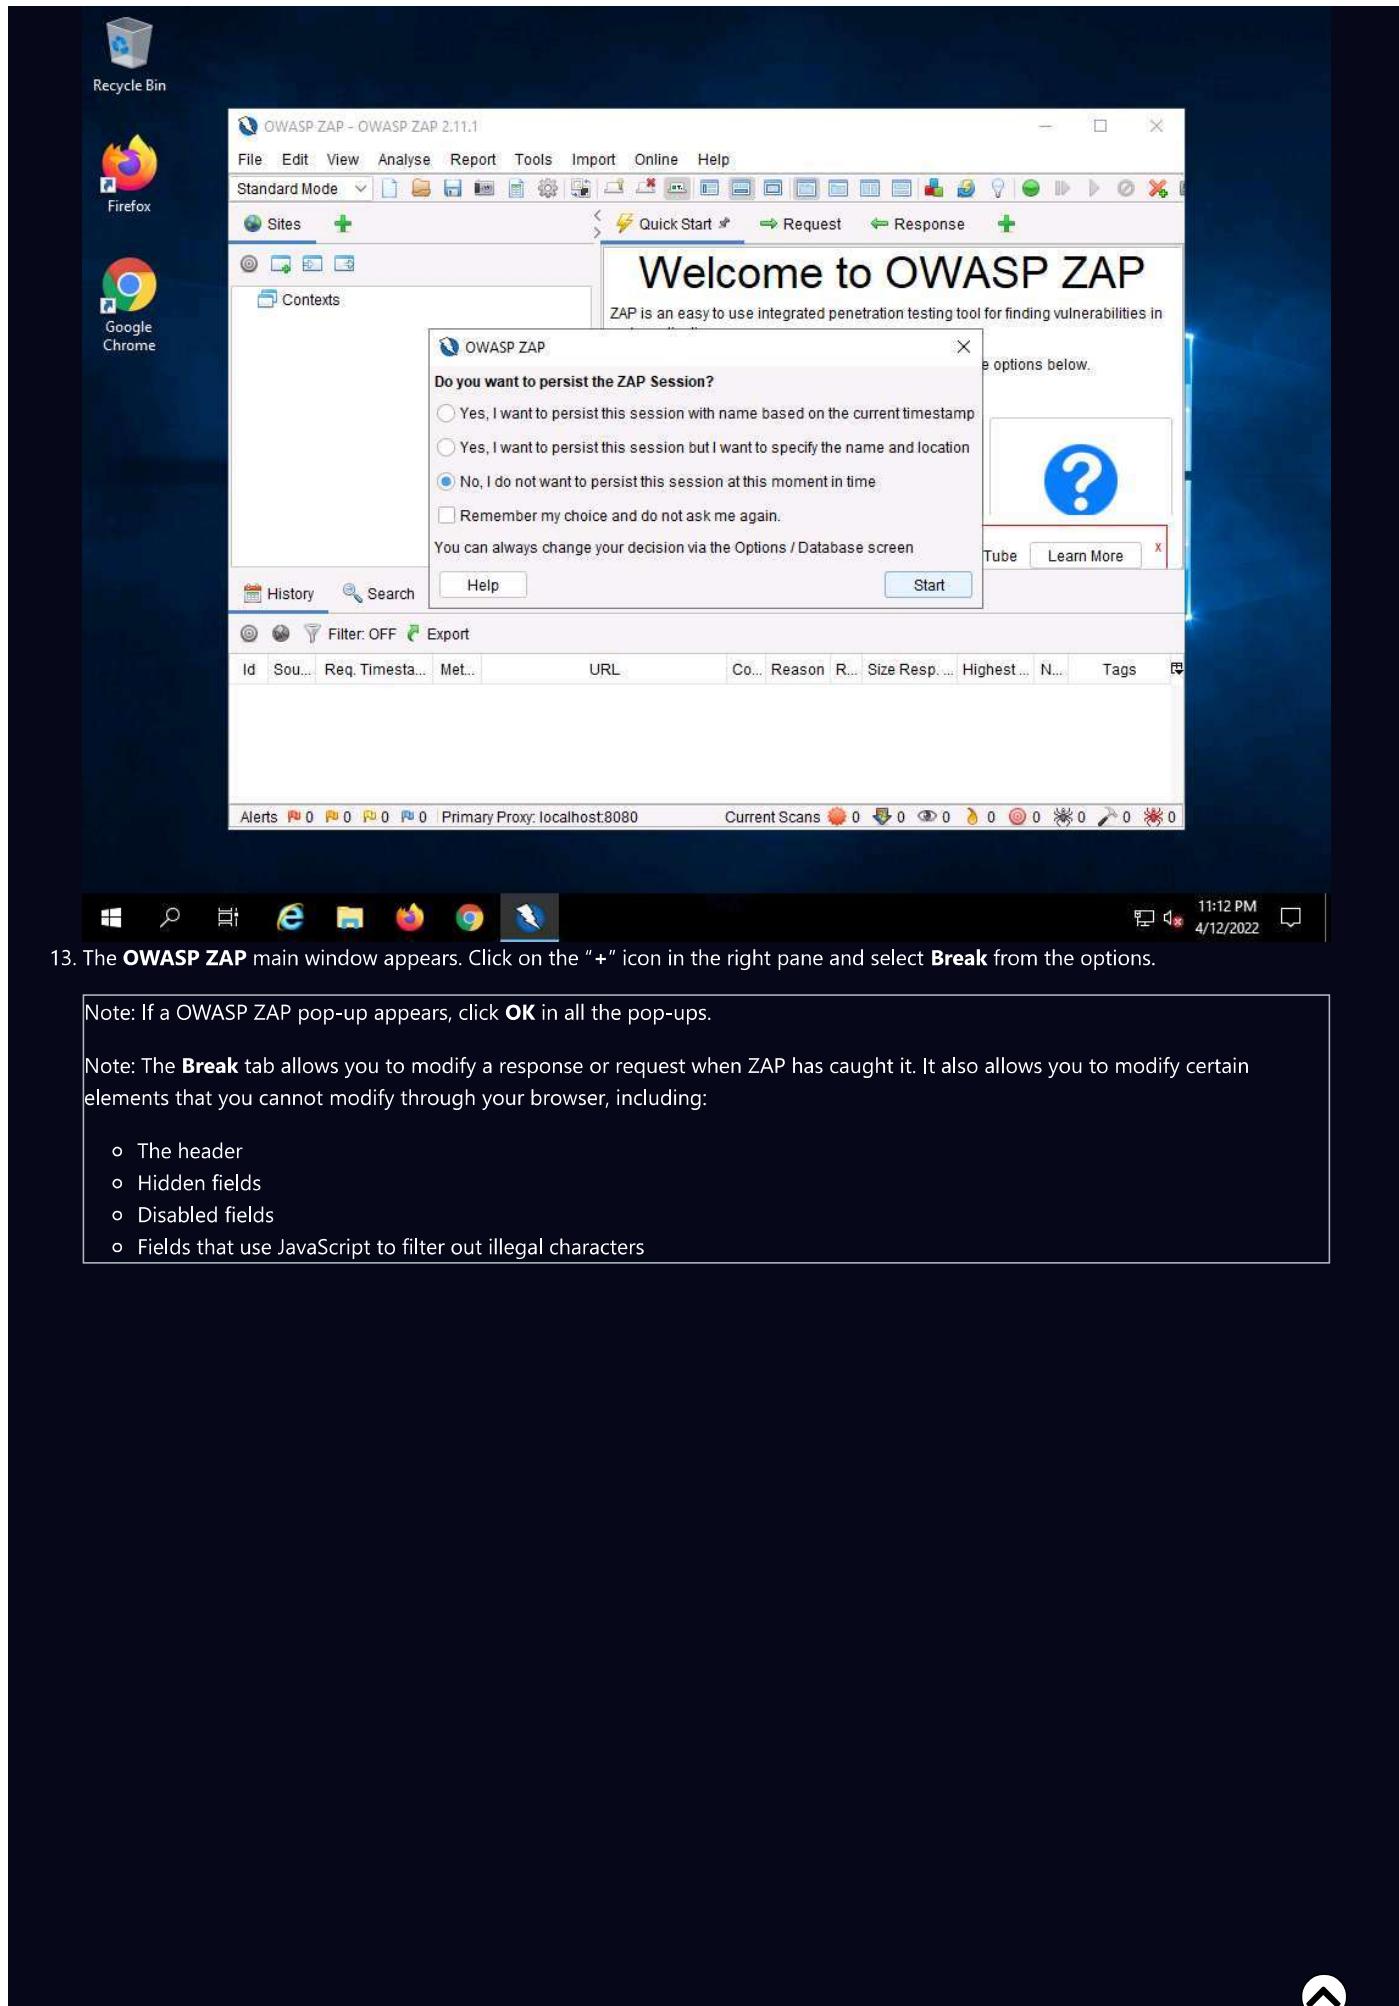

10. Click **CEHv12 Windows Server 2019** to switch to the **Windows Server 2019** machine. Click **Ctrl+Alt+Del** to activate the machine, by default, **Administrator** account is selected, type **Pa\$\$w0rd** in the Password field and press **Enter**

11. Click **Type here to search** icon () on the **Desktop**. Type **zap** in the search field, the **ZAP 2.11.1** appears in the result, press **Enter** to launch it.

12. OWASP ZAP initializes and a prompt that reads **Do you want to persist the ZAP Session?** appears. Select the **No, I do not want to persist this session at this moment in time** radio button and click **Start**.

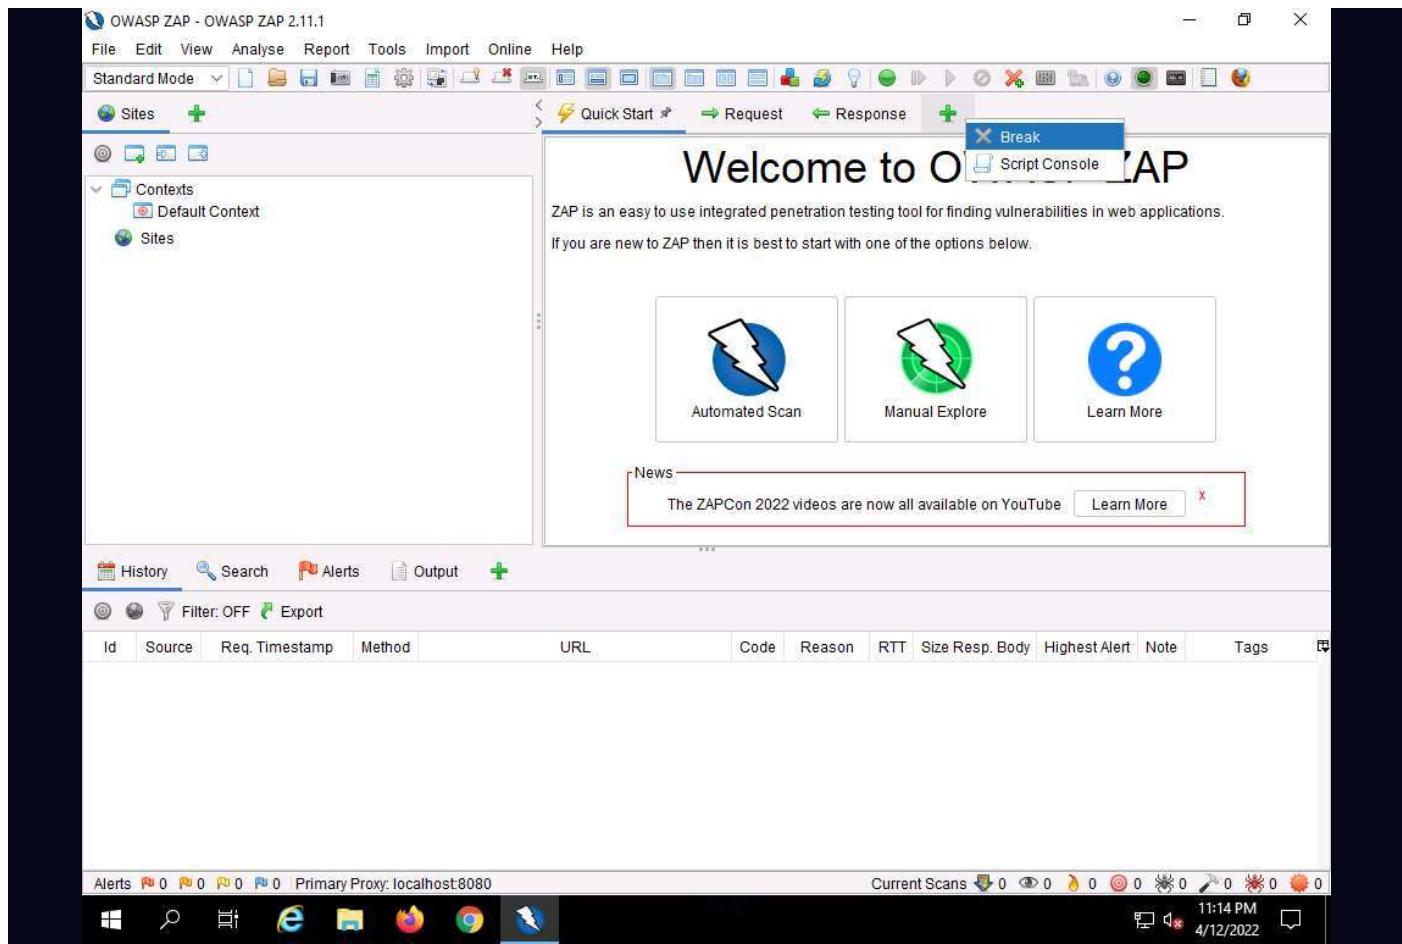

13. The **OWASP ZAP** main window appears. Click on the "+" icon in the right pane and select **Break** from the options.

Note: If a OWASP ZAP pop-up appears, click **OK** in all the pop-ups.

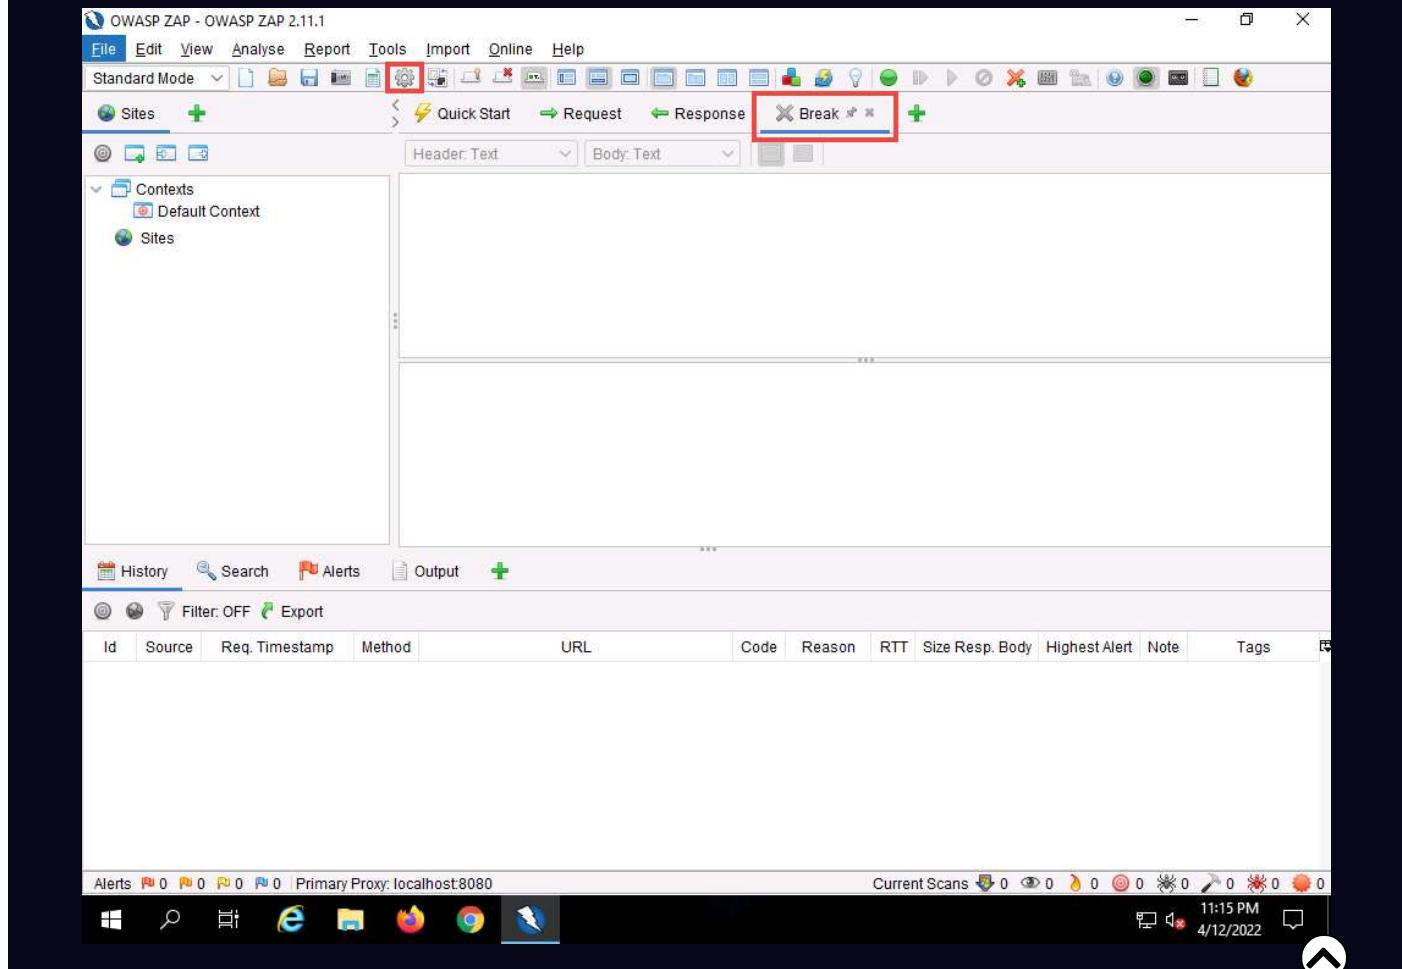

Note: The **Break** tab allows you to modify a response or request when ZAP has caught it. It also allows you to modify certain elements that you cannot modify through your browser, including:

- o The header
- o Hidden fields
- o Disabled fields
- o Fields that use JavaScript to filter out illegal characters

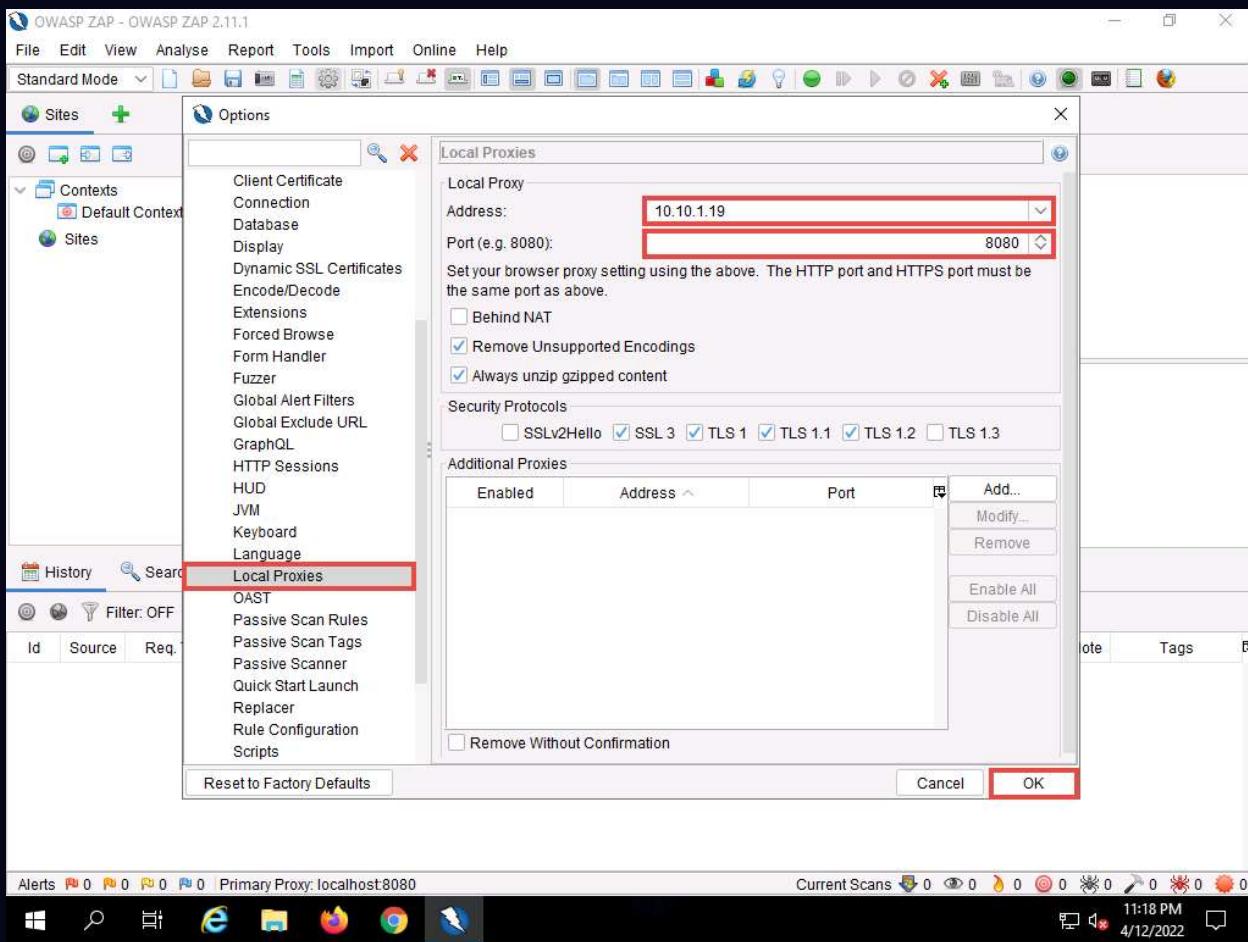

14. The **Break** tab is added to your **OWASP ZAP** window.

15. To configure ZAP as a proxy, click the **Options...** icon from the toolbar.

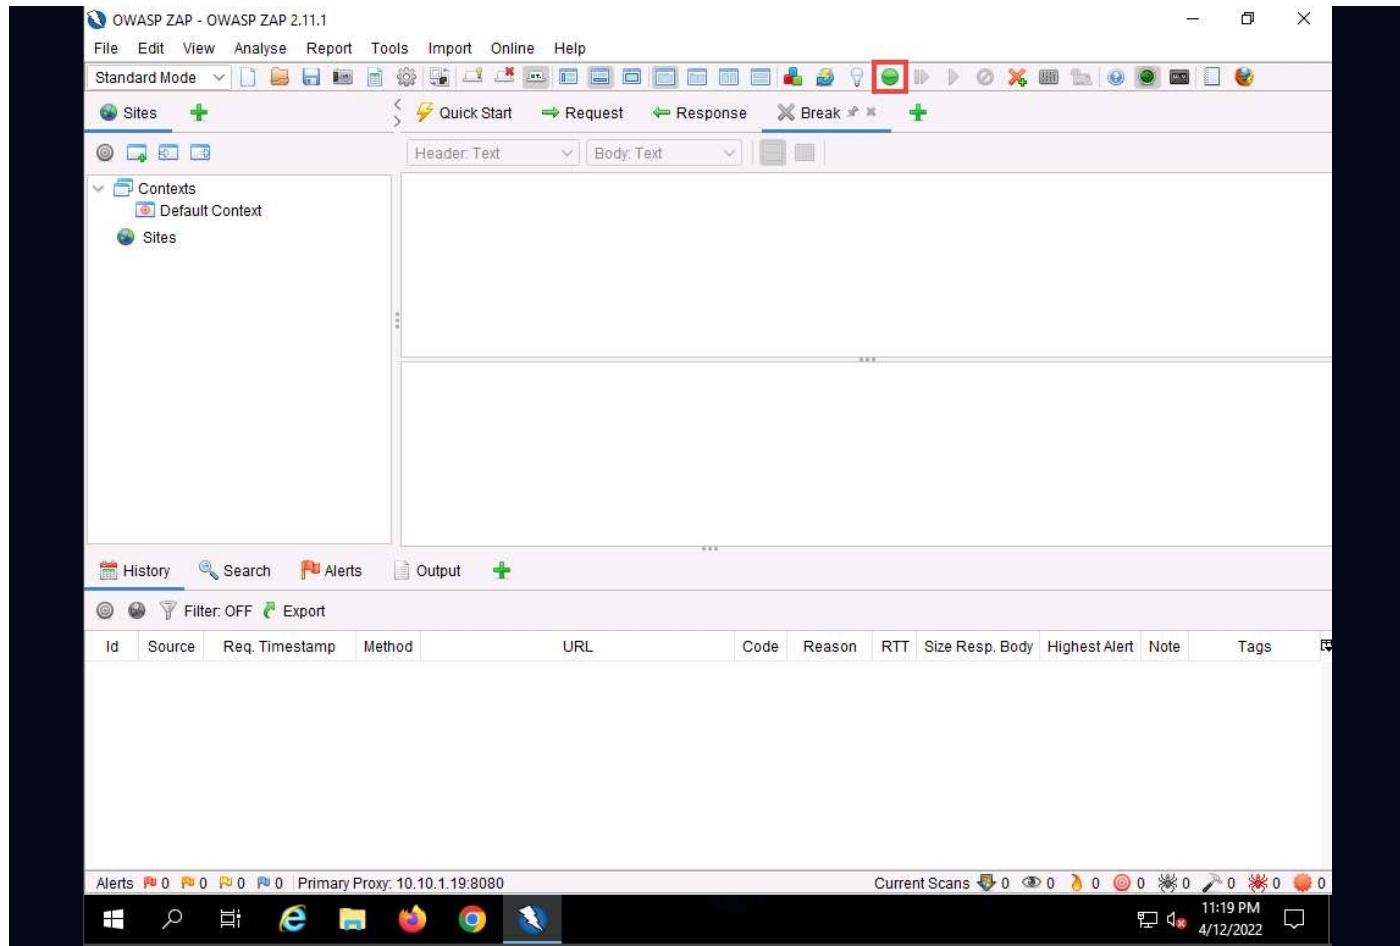

16. In the **Options** window, scroll-down in the left-pane and click **Local Proxies**. In the right pane, under the **Local Proxy** section, type **10.10.1.19** (the IP address of the **Windows Server 2019** machine) in the **Address** field and leave the **Port** value to the default, **8080**; click **OK**.

17. Click the **Set break on all requests and responses** icon on the main ZAP toolbar. This button sets and unsets a global breakpoint that will trap and display the next response or request from the victim's machine in the **Break** tab.

Note: The **Set break on all requests and responses** icon turns automatically from green to red.

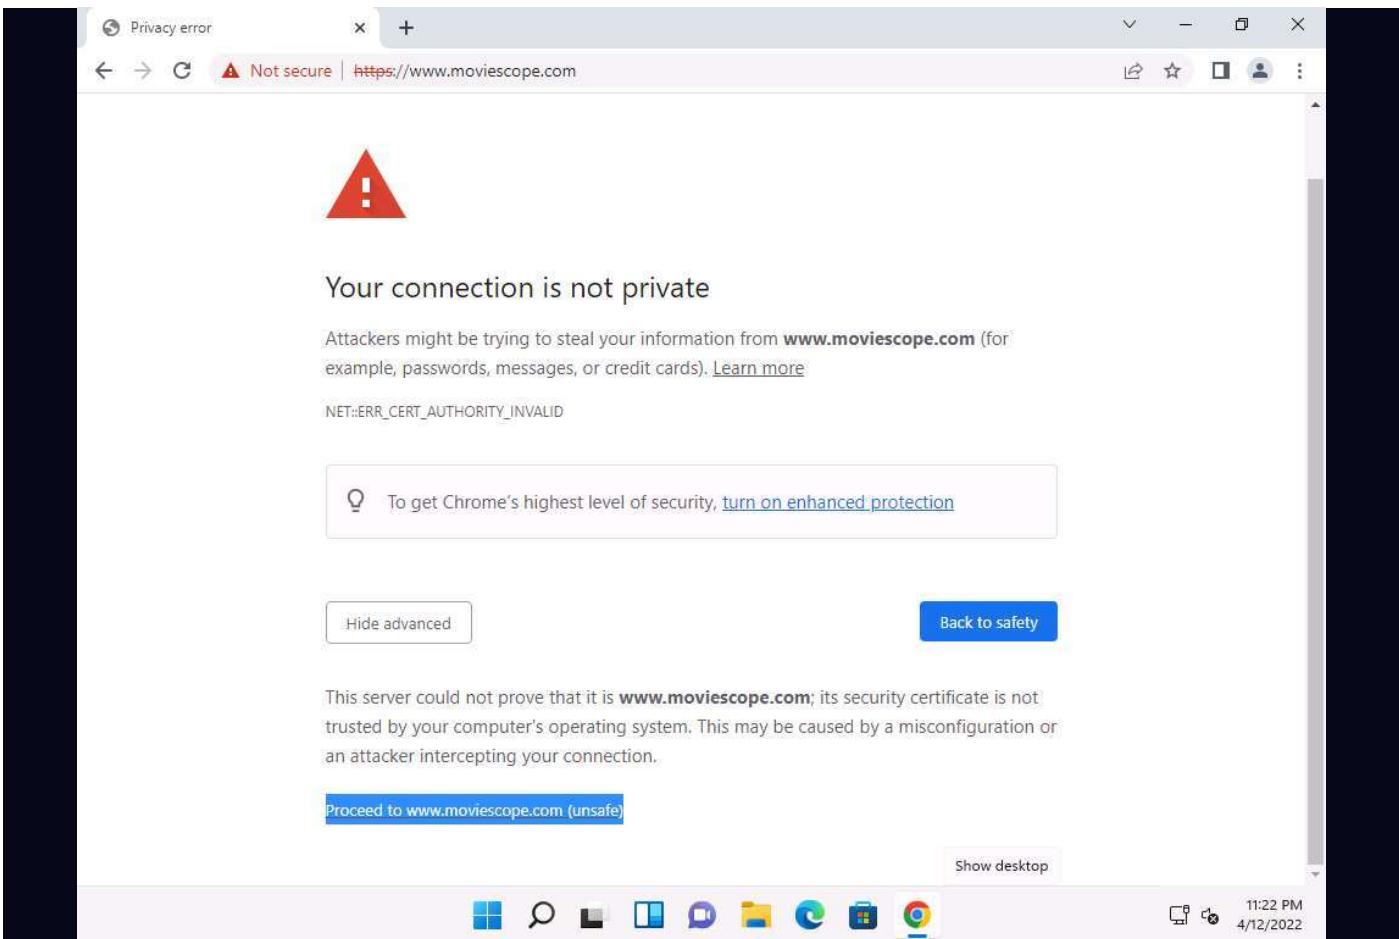

18. Now, click **CEHv12 Windows 11** to switch back to the victim's machine (**Windows 11**) and launch the same browser in which you configured the proxy settings. In this task, we have configured the **Google Chrome** browser.

19. Place your mouse cursor in the address bar, type **www.moviescope.com** and press **Enter**.

20. A message appears, stating that **Your connection is not private**. Click the **Advanced** button.

21. On the next page, click **Proceed to www.moviescope.com (unsafe)** to open the website.

22. Now, click **CEHv12 Windows Server 2019** to switch back to the attacker machine (**Windows Server 2019**) and observe that **OWASP ZAP** has begun to capture the requests of the victim's machine.

23. In Steps **19-21**, we have visited **www.moviescope.com** in the victim's browser. Look in the **Break** tab and click the **Submit and step to next request or response** icon on the toolbar to capture the **www.moviescope.com** request.

GET http://www.moviescope.com/ HTTP/1.1
Host: www.moviescope.com
Connection: keep-alive
Cache-Control: max-age=0
sec-ch-ua: " Not A;Brand";v="99", "Chromium";v="100", "Google Chrome";v="100"
sec-ch-ua-mobile: ?0
sec-ch-ua-platform: "Windows"
Upgrade-Insecure-Requests: 1
User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/100.0.4896.88 Safari/537.36
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/avif,image/webp,image/apng,*/*;q=0.8,
application/signed-exchange;v=b3;q=0.9
Sec-Fetch-Site: none

24. A **HTTP response** appears; click the **Submit and step to next request or response** icon again on the toolbar.

HTTP/1.1 200 OK
Cache-Control: private
Content-Type: text/html; charset=utf-8
Server: Microsoft-IIS/10.0
X-AspNet-Version: 4.0.30319
X-Powered-By: ASP.NET
Date: Wed, 13 Apr 2022 06:25:15 GMT
Content-Length: 4326

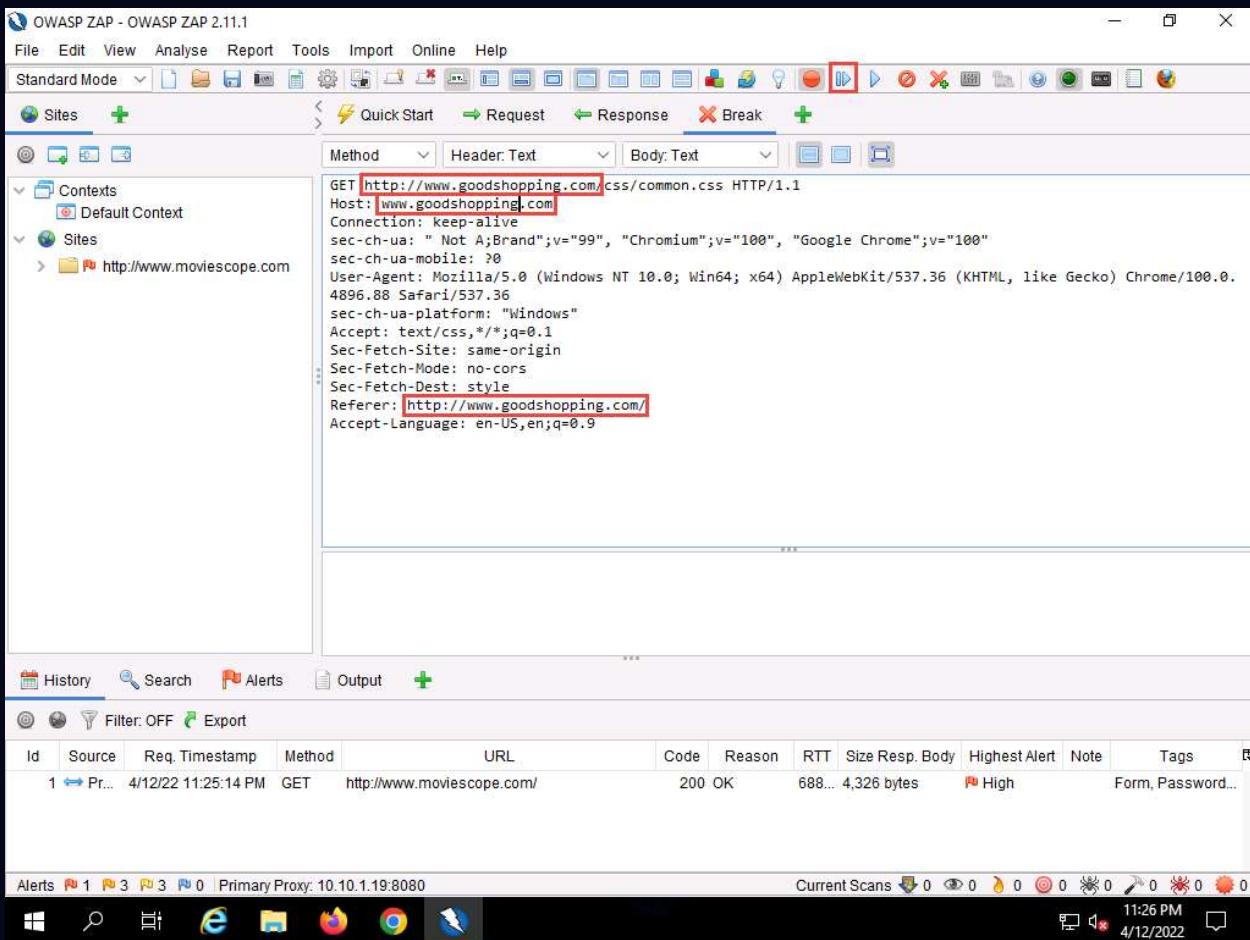

<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<meta charset="utf-8"/>
<meta name="viewport" content="width=device-width, initial-scale=1, minimum-scale=1, maximum-scale=1"/>

25. Now, in the **Break** tab, modify **www.moviescope.com** to **www.goodshopping.com** in all the captured GET requests.

Note: If you find any URL starting with **https**, modify it to **http**.

26. Once you have modified the GET requests, click the **Submit and step to next request or response** icon on the toolbar to forward the traffic to the victim's machine.

27. In all the **HTTP Not Found** requests, click the **Submit and step to next request or response** icon on the toolbar to forward the traffic.

The screenshot shows the OWASP ZAP interface in Standard Mode. The left sidebar shows 'Contexts' and 'Sites'. A selected site is 'http://www.moviescope.com'. The main pane shows a captured request for this site. The response header is highlighted with a red box:

```

HTTP/1.1 404 Not Found
Cache-Control: private
Content-Type: text/html; charset=utf-8
Server: Microsoft-IIS/10.0
X-Powered-By: ASP.NET
Date: Wed, 13 Apr 2022 06:27:40 GMT
Content-Length: 4872

```

The response body contains the HTML code for an IIS 404 error page:

```

<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN" "http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>IIS 10.0 Detailed Error - 404.0 - Not Found</title>
<style type="text/css">
<!--
body{margin:0;font-size:.7em;font-family:Verdana,Arial,Helvetica,sans-serif;}
code{margin:0;color:#006600;font-size:1.1em;font-weight:bold;}
.config_source code{font-size:.8em;color:#000000;}
pre{margin:0;font-size:1.4em;word-wrap:break-word;}
ul,ol{margin:10px 0 10px 5px;}
ul.first,ol.first{margin-top:5px;}...

```

Below the main pane, there's a table of captured requests:

ID	Source	Req. Timestamp	Method	URL	Code	Reason	RTT	Size Resp. Body	Highest Alert	Note	Tags
1	Pr...	4/12/22 11:25:14 PM	GET	http://www.moviescope.com/	200	OK	688...	4,326 bytes	High		Form, Password...

At the bottom, there's a taskbar with icons for various applications and a system status bar showing '11:28 PM 4/12/2022'.

28. In a similar way, modify every **GET** request captured by **OWASP ZAP** until you see the **www.goodshopping.com** page in the victim's machine.

Note: You will need to switch back and forth from the victim's machine to see the browser status while you do this.

Note: If you do not receive any request or you see a blank break tab then switch to **Windows 11** machine and refresh the browser to capture the request again.

29. Now, click on **CEHv12 Windows 11** to switch to the victim's machine (**Windows 11**); the browser displays the website that the attacker wants the victim's machine to see (in this example, **www.goodshopping.com**).

Note: It takes multiple iterations to open the Good Shopping site in the victim's machine.

30. The victim has navigated to **www.moviescope.com**, but now sees **www.goodshopping.com**; while the address bar displays **www.moviescope.com**, the window displays **www.goodshopping.com**.

31. Now, we shall change the proxy settings back to the default settings. To do so, perform **Steps 3-5** again.

32. In the **Settings** window, under the **Manual proxy setup** section in the right-pane, click the **Edit** button.

← Settings

Admin Local Account

Find a setting

Network & internet > Proxy

Use a proxy server for Ethernet or Wi-Fi connections. These settings don't apply to VPN connections.

Automatic proxy setup

Automatically detect settings On

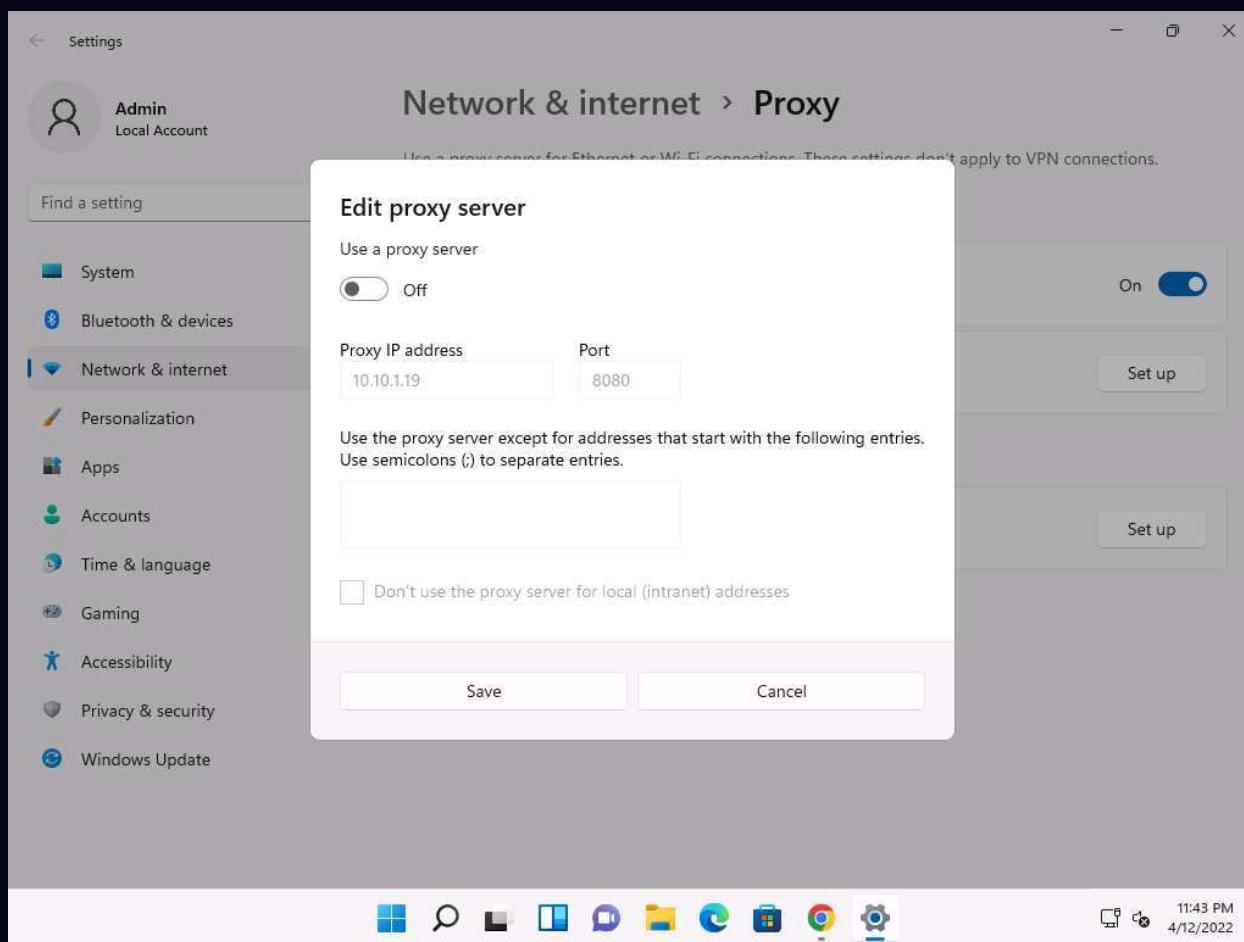

Use setup script Off Set up

Manual proxy setup

Use a proxy server On Edit

Get help Give feedback

33. Edit proxy server window appears, under the **Use a proxy server** option, click the **On** button to switch it **Off** and click **Save**.

34. This concludes the demonstration of performing session hijacking using ZAP.

35. Close all open windows and document all the acquired information.

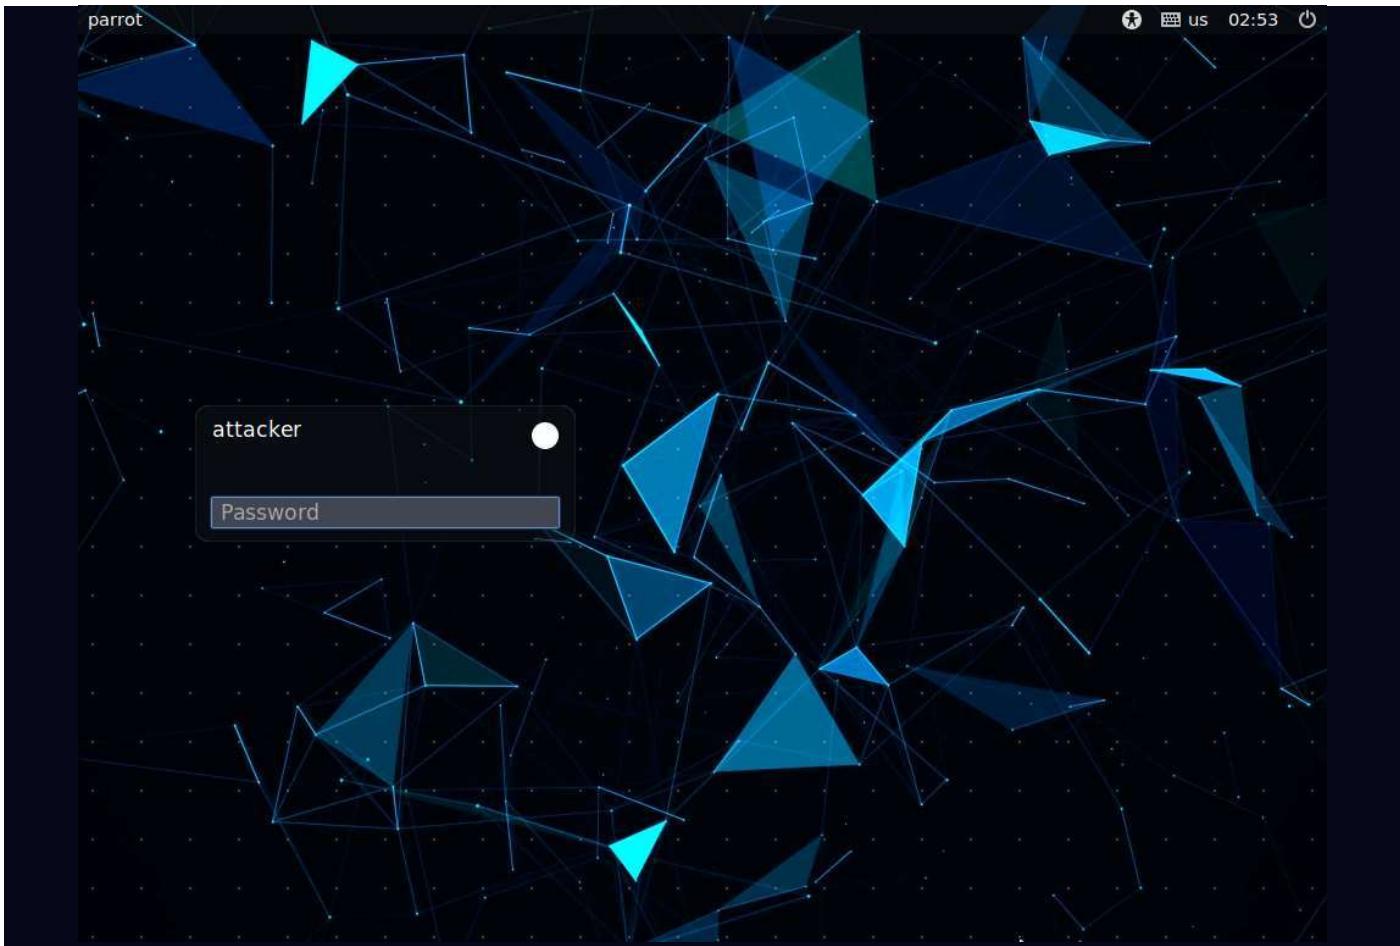

Task 2: Intercept HTTP Traffic using bettercap

Attackers can use session hijacking to launch various kinds of attacks such as man-in-the middle (MITM) attacks. In an MITM attack, the attacker places himself/herself between the authorized client and the webserver so that all information traveling in either direction passes through them.

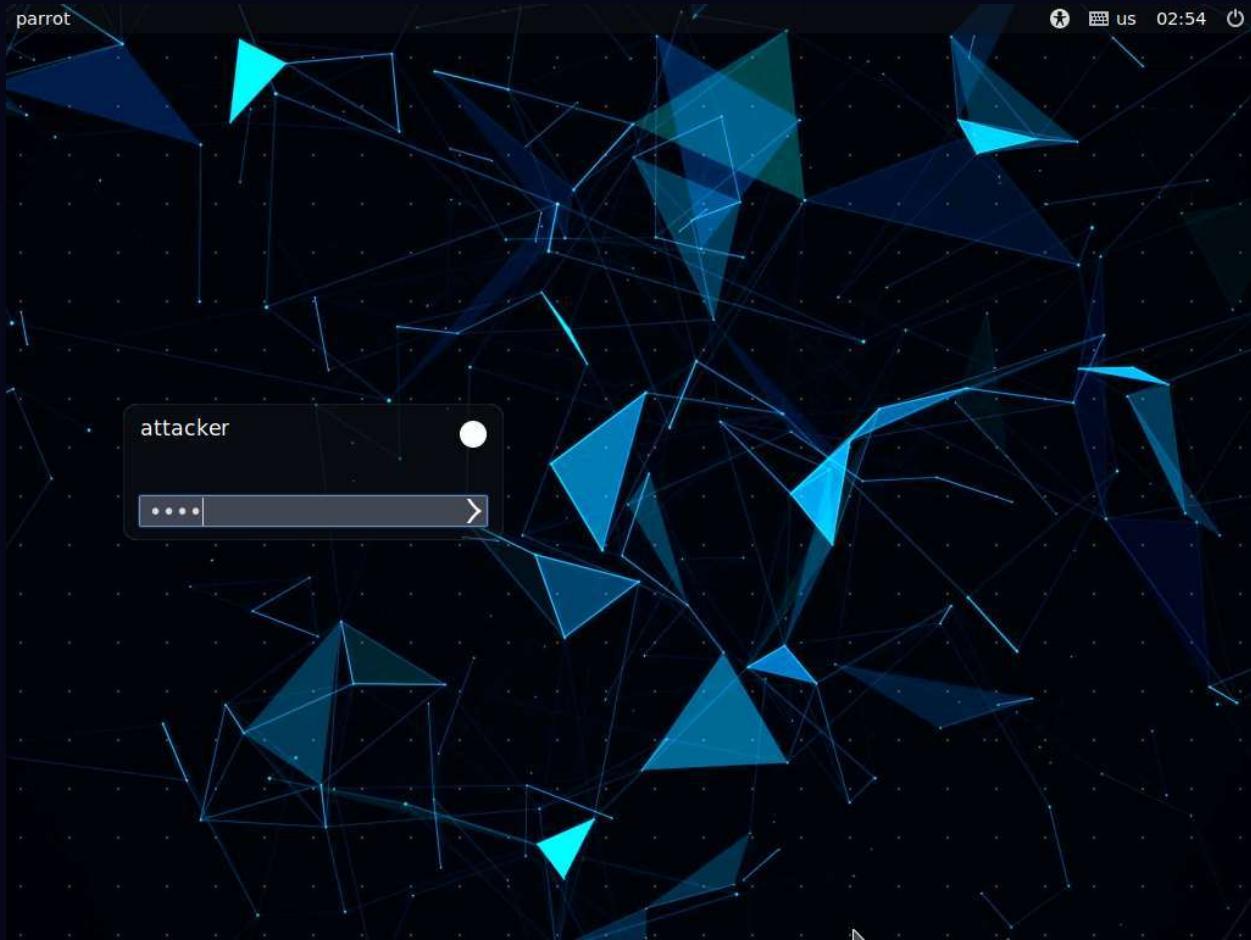

An ethical hacker or a penetration tester, you must know how MITM attacks work, so that you can protect your organization's sensitive information from them. bettercap is a powerful, flexible, and portable tool created to perform various types of MITM attacks against a network; manipulate HTTP, HTTPS, and TCP traffic in real-time; sniff for credentials; etc.

Here, we will use the bettercap tool to intercept HTTP traffic on the target system.

1. Click **CEHv12 Parrot Security** to switch to the **Parrot Security** machine.

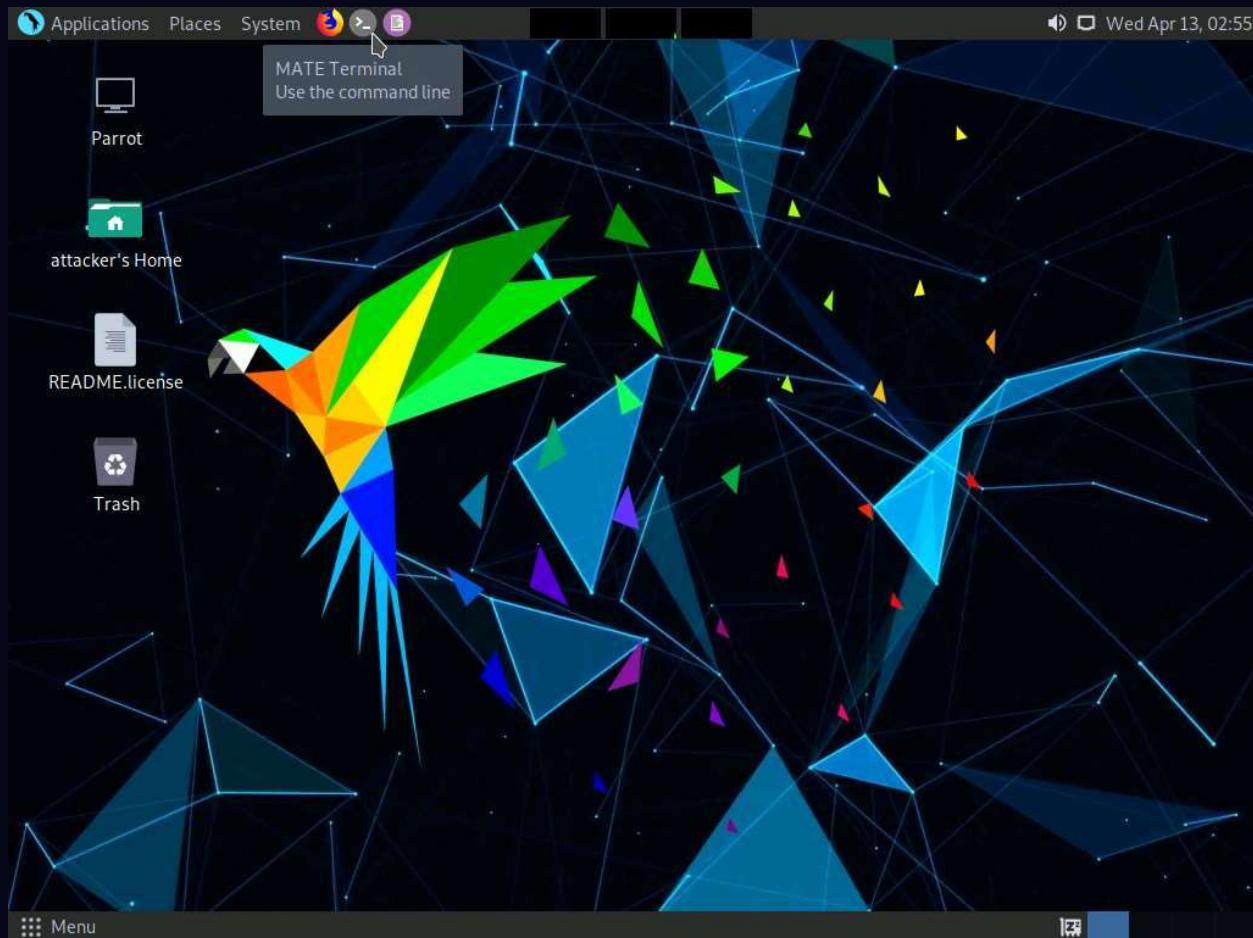

2. In the login page, the **attacker** username will be selected by default. Enter password as **toor** in the **Password** field and press **Enter** to log in to the machine.

3. Click the **MATE Terminal** icon at the top of the **Desktop** window to open a Terminal window.

Note: If a **Question** pop-up window appears asking you to update the machine, click **No** to close the window.

4. A **Parrot Terminal** window appears. In the terminal window, type **sudo su** and press **Enter** to run the programs as a root user.

5. In the **[sudo] password for attacker** field, type **toor** as a password and press **Enter**.

Note: The password that you type will not be visible.

6. Now, type **cd** and press **Enter** to jump to the root directory.

```
[attacker@parrot:~]$
[attacker@parrot:~]$ sudo su
[sudo] password for attacker:
[root@parrot:~/home/attacker]
[root@parrot:~/home/attacker]$ #cd
[root@parrot:~]#
#
```

7. In the terminal window; type **bettercap -h** and press **Enter**.

Note: In this command, **-h**: requests a list of the available options.

```
[root@parrot:~]#
[root@parrot:~]$ #bettercap -h
Usage of bettercap:
-autostart string
    Comma separated list of modules to auto start. (default "events.stream")
-caplet string
    Read commands from this file and execute them in the interactive session.
-cpu-profile file
    Write cpu profile file.
-debug
    Print debug messages.
-env-file string
    Load environment variables from this file if found, set to empty to disable environment persistence.
-eval string
    Run one or more commands separated by ; in the interactive session, used to set variables via command line.
-gateway-override string
    Use the provided IP address instead of the default gateway. If not specified or invalid, the default gateway will be used.
-iface string
    Network interface to bind to, if empty the default interface will be auto selected.
-mem-profile file
    Write memory profile to file.
-no-colors
    Disable output color effects.
-no-history
    Disable interactive session history file.
-silent
    Suppress all logs which are not errors.
```

8. In the terminal window, type **bettercap -iface eth0** and press **Enter** to set the network interface.

Note: **-iface**: specifies the interface to bind to (in this example, **eth0**).

9. Type **help** and press **Enter** to view the list of available modules in bettercap.

The screenshot shows a terminal window titled "bettercap -iface eth0 - Parrot Terminal". The window has a dark theme with green text. At the top, there's a menu bar with "File", "Edit", "View", "Search", "Terminal", and "Help". Below the menu is a command prompt: "[root@parrot]~[-]". The user types "#bettercap -iface eth0" and presses Enter. The terminal then displays the help documentation for bettercap v2.29, which includes various commands like help, active, quit, sleep, get, set, read, clear, include, !, alias, and modules. The "Modules" section lists several modules: any.proxy, api.rest, arp.spoof, ble.recon, caplets, dhcp6.spoof, dns.spoof, and events.stream. The status of each module is shown as either "running" or "not running".

```
[root@parrot]~[-]
#bettercap -iface eth0
bettercap v2.29 (built for linux amd64 with go1.17.1) [type 'help' for a list of commands]

10.10.1.0/24 > 10.10.1.13 » [02:56:20] [sys.log] [war] Could not find mac for 10.10.1.2
10.10.1.0/24 > 10.10.1.13 » help

    help MODULE : List available commands or show module specific help if no module name is provided.
    active : Show information about active modules.
    README license
    quit : Close the session and exit.
    sleep SECONDS : Sleep for the given amount of seconds.
    get NAME : Get the value of variable NAME, use * alone for all, or NAME* as a wildcard.
    set NAME VALUE : Set the VALUE of variable NAME.
    read VARIABLE PROMPT : Show a PROMPT to ask the user for input that will be saved inside VARIABLE.
    clear : Clear the screen.
    include CAPLET : Load and run this caplet in the current session.
    ! COMMAND : Execute a shell command and print its output.
    alias MAC NAME : Assign an alias to a given endpoint given its MAC address.

Modules

any.proxy > not running
api.rest > not running
arp.spoof > not running
ble.recon > not running
caplets > not running
dhcp6.spoof > not running
dns.spoof > not running
events.stream > running
```

10. Type **net.probe on** and press **Enter**. This module will send different types of probe packets to each IP in the current subnet for the **net.recon** module to detect them.

11. Type **net.recon on** and press **Enter**. This module is responsible for periodically reading the system ARP table to detect new hosts on the network.

Note: The net.recon module displays the detected active IP addresses in the network. In real-time, this module will start sniffing network packets.

12. Type **set http.proxy.sslstrip true** and press **Enter**. This module enables SSL stripping.

The screenshot shows a terminal window titled "bettercap -iface eth0 - Parrot Terminal". The window has a dark background with green and yellow text. The terminal displays the following output:

```

::: Menu bettercap -iface eth0 - ...
```

22. Click **CEHv12 Windows 11** to switch to the **Windows 11** machine. On the **MovieScope** website, enter any credentials (here, **sam/test**) and press **Enter** to log in.

23. Click **CEHv12 Parrot Security** to switch to the **Parrot Security** machine. You can observe the details of both the browsed website and the credentials obtained in plain text, as shown in the screenshot.

Note: bettercap collects all http logins used by routers, servers, and websites that do not have SSL enabled. In this task, we are using **www.moviescope.com** for demonstration purposes, as it is http-based. To use bettercap to sniff network traffic from https-based websites, you must enable the SSL strip module by issuing the command **set http.proxy.sslstrip true**.

26. This concludes the demonstration of how to intercept HTTP traffic using bettercap.

27. Close all open windows and document all the acquired information.

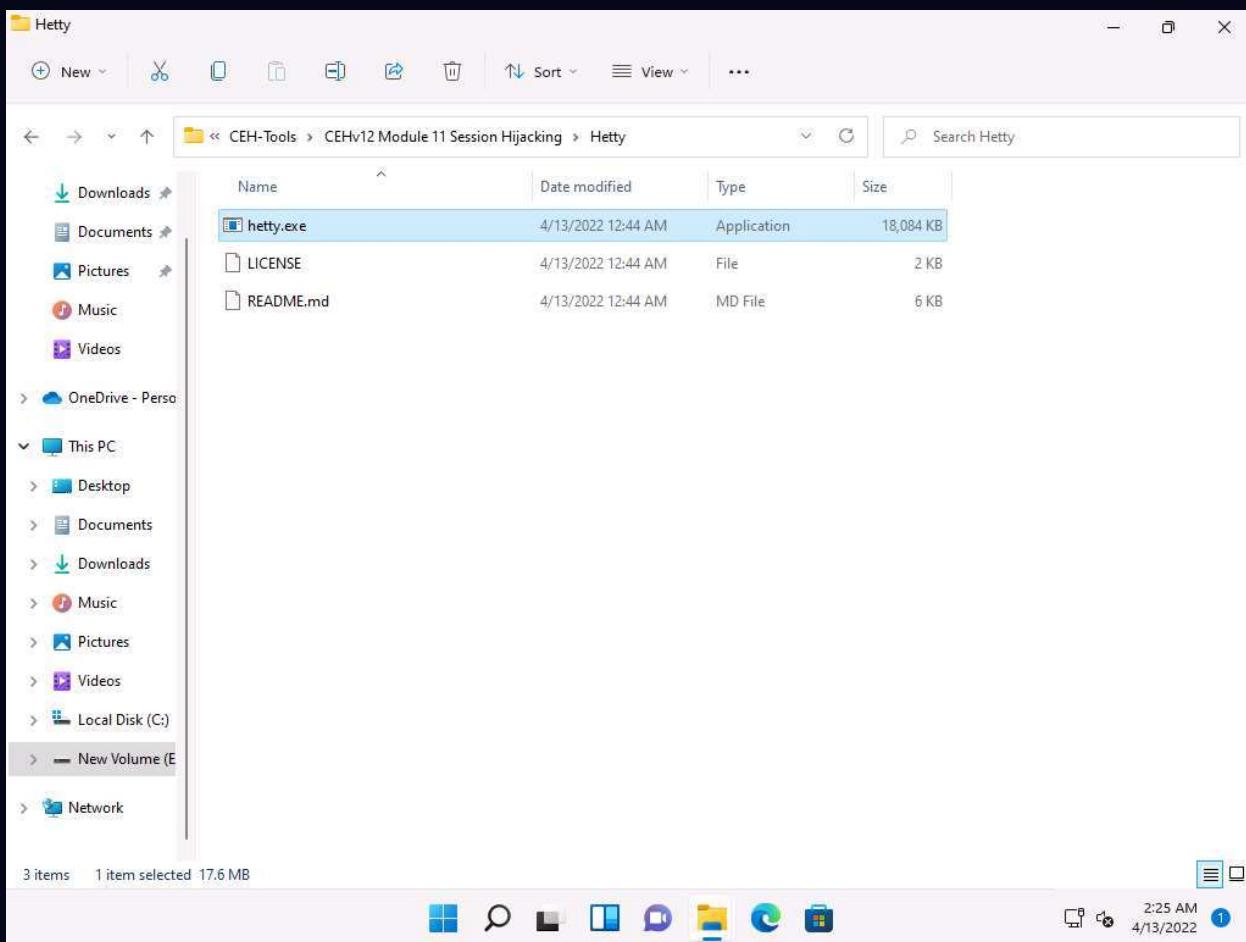

Task 3: Intercept HTTP Traffic using Hetty

Hetty is an HTTP toolkit for security research. It aims to become an open-source alternative to commercial software such as Burp Suite Pro, with powerful features tailored to the needs of the InfoSec and bug bounty communities. Hetty can be used to perform Machine-in-the-middle (MITM) attack, manually create/edit requests, and replay proxied requests for HTTP clients and further intercept requests and responses for manual review.

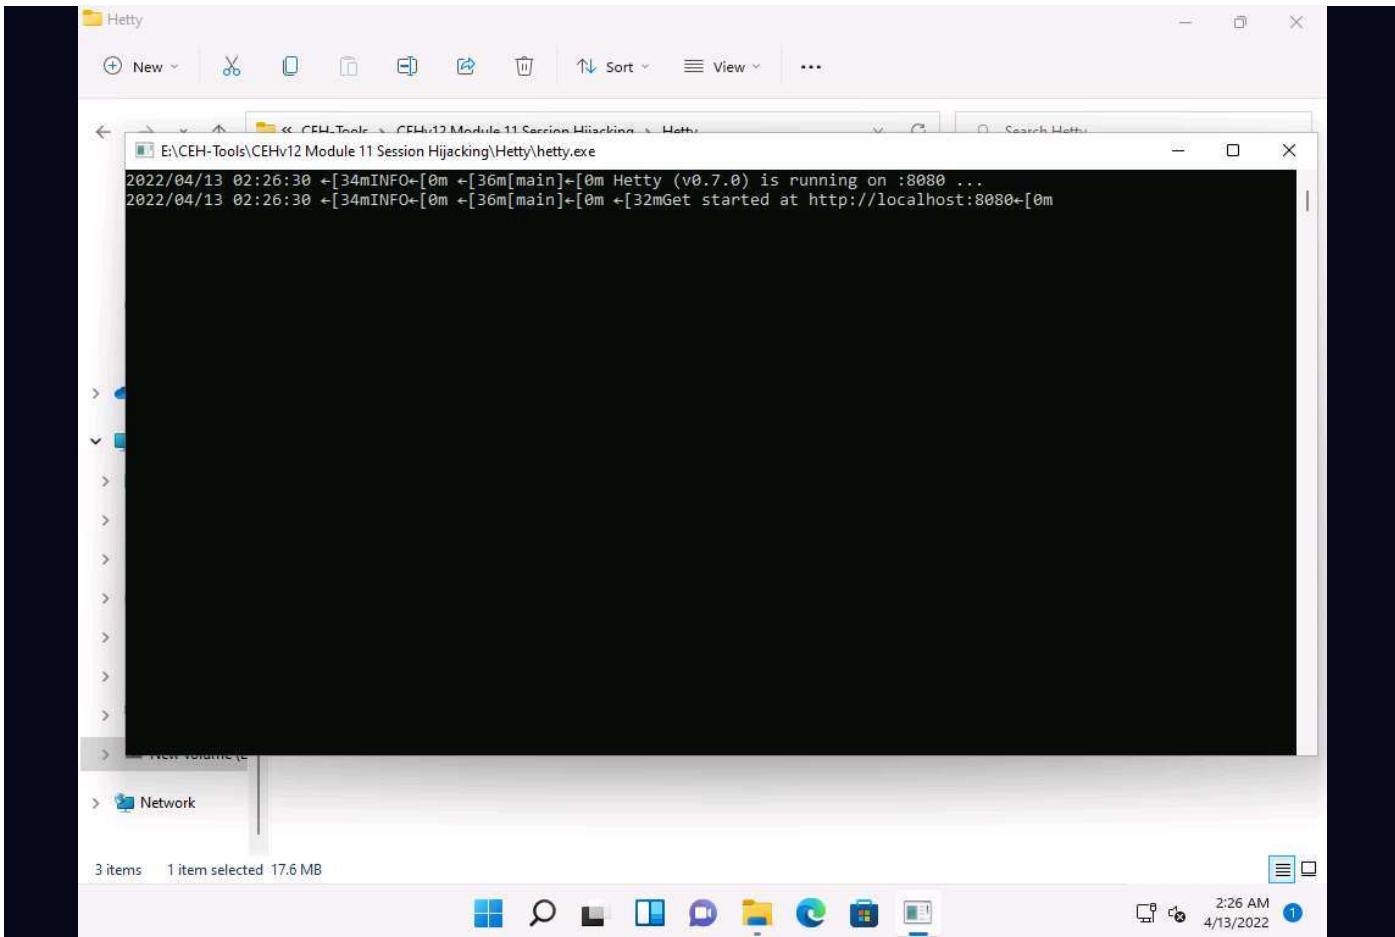

Here, we will use the Hetty tool to intercept HTTP traffic on the target system.

Note: Here, we will use **Windows 11** machine as an attacker machine and **Windows Server 2022** machine as a target machine.

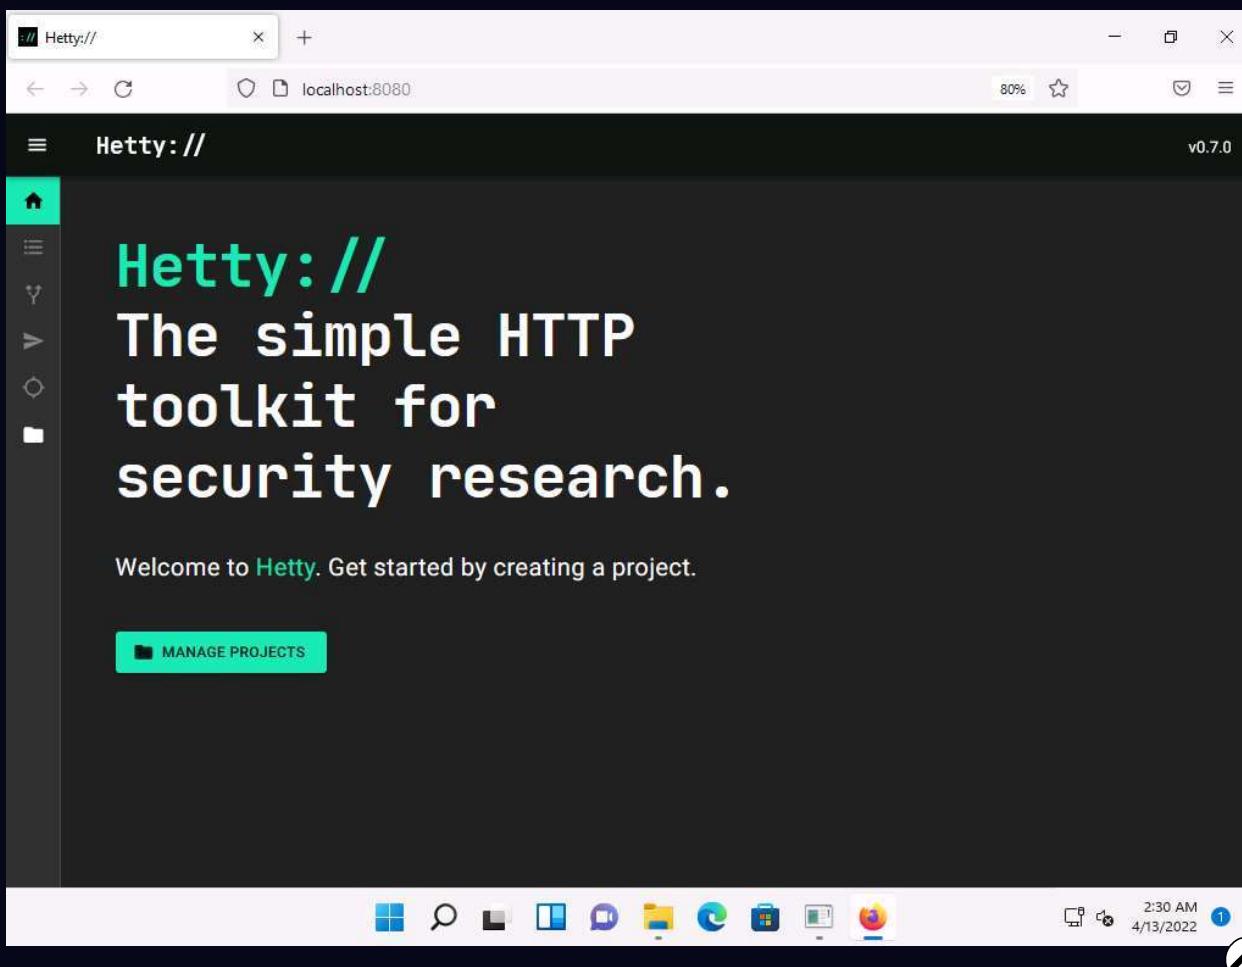

1. Click **CEHv12 Windows 11** to switch to the **Windows 11** machine.
 2. Navigate to **E:\CEH-Tools\CEHv12 Module 11 Session Hijacking\Hetty** and double-click **hetty.exe**.

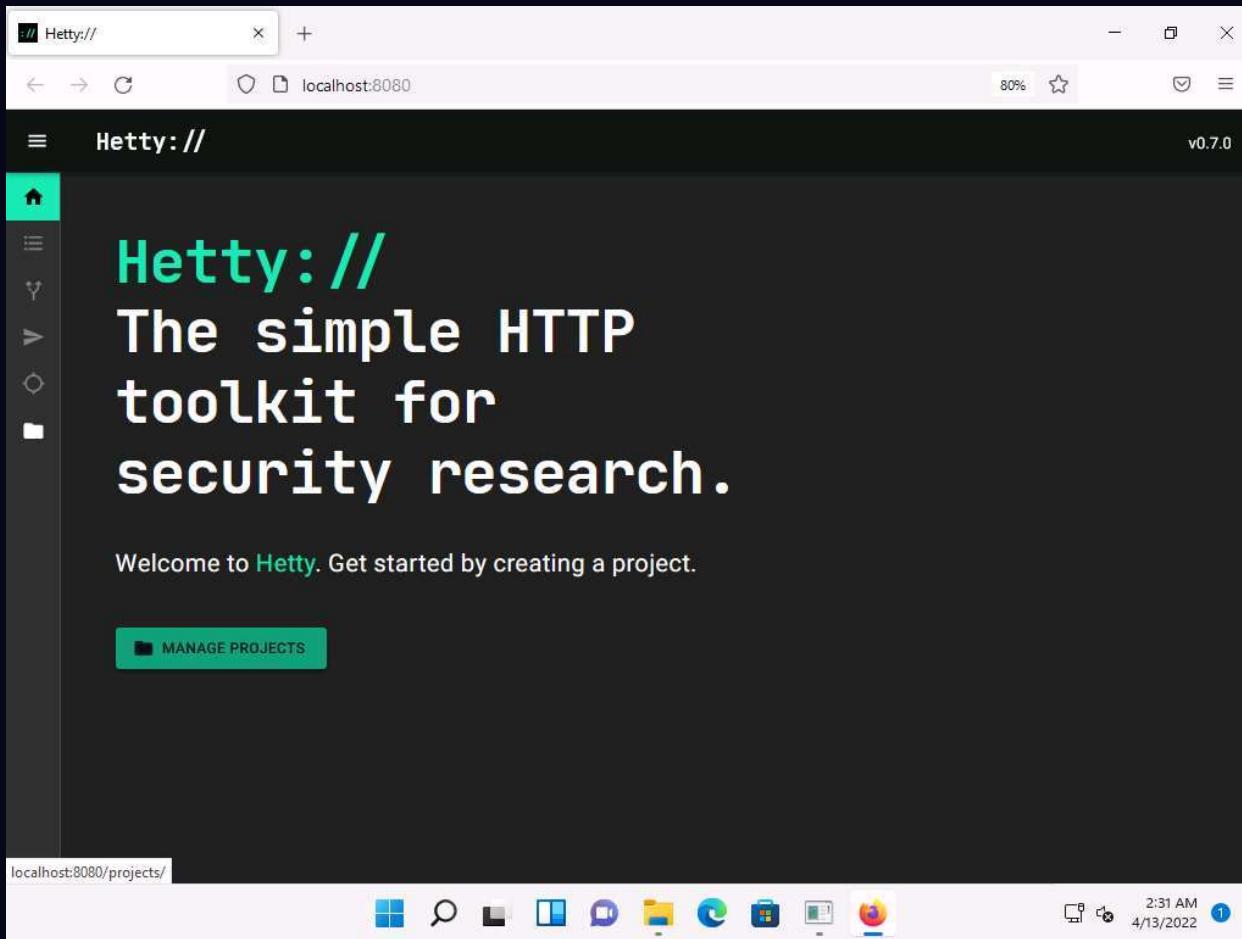

3. **Open File - Security Warning** window appears, click **Run**.
 4. A **Command Prompt** window appears, and Hetty initializes.

5. Now, minimize all the windows and launch any web browser (here, **Mozilla Firefox**).
6. A browser window, in the address bar, type **http://localhost:8080** and press **Enter** to open Hetty dashboard.

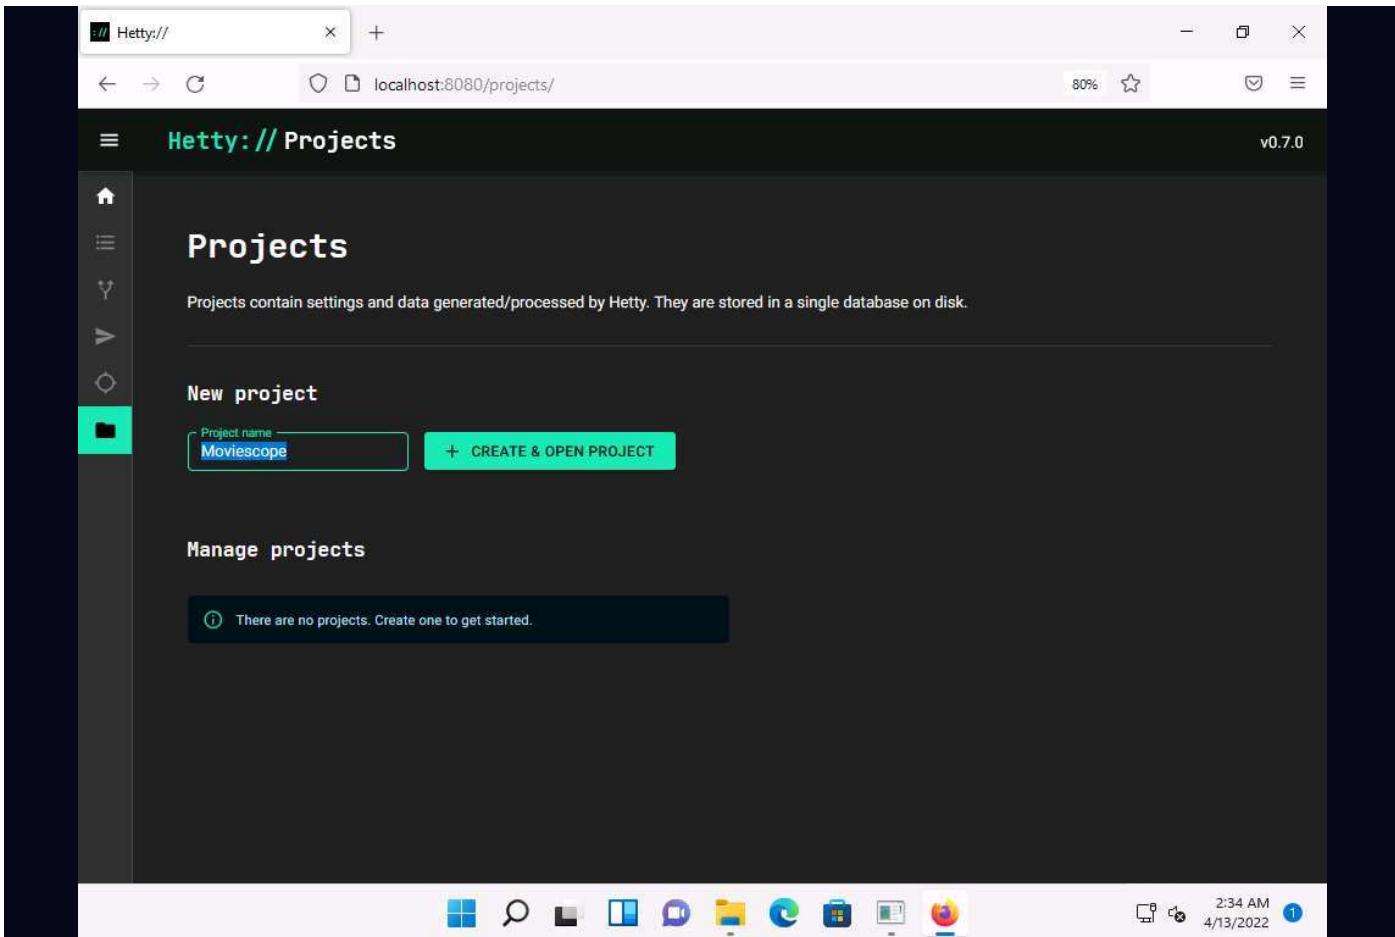

7. In the Hetty dashboard, click **MANAGE PROJECTS** button.

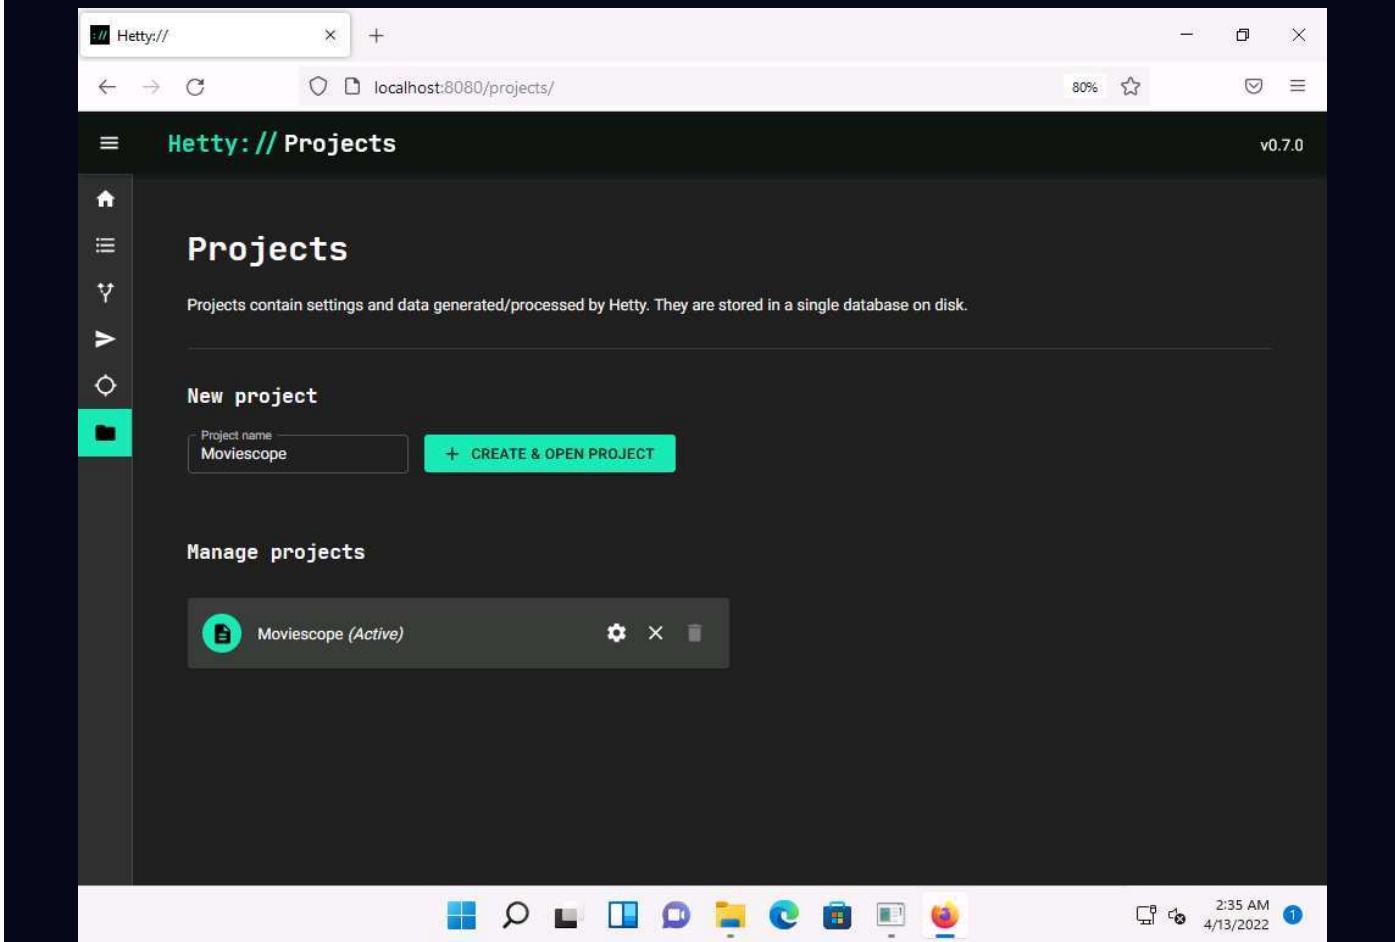

8. Projects page appears, type **Project name** as **Moviescope** under **New Project** section and click + **CREATE & OPEN PROJECT** button.

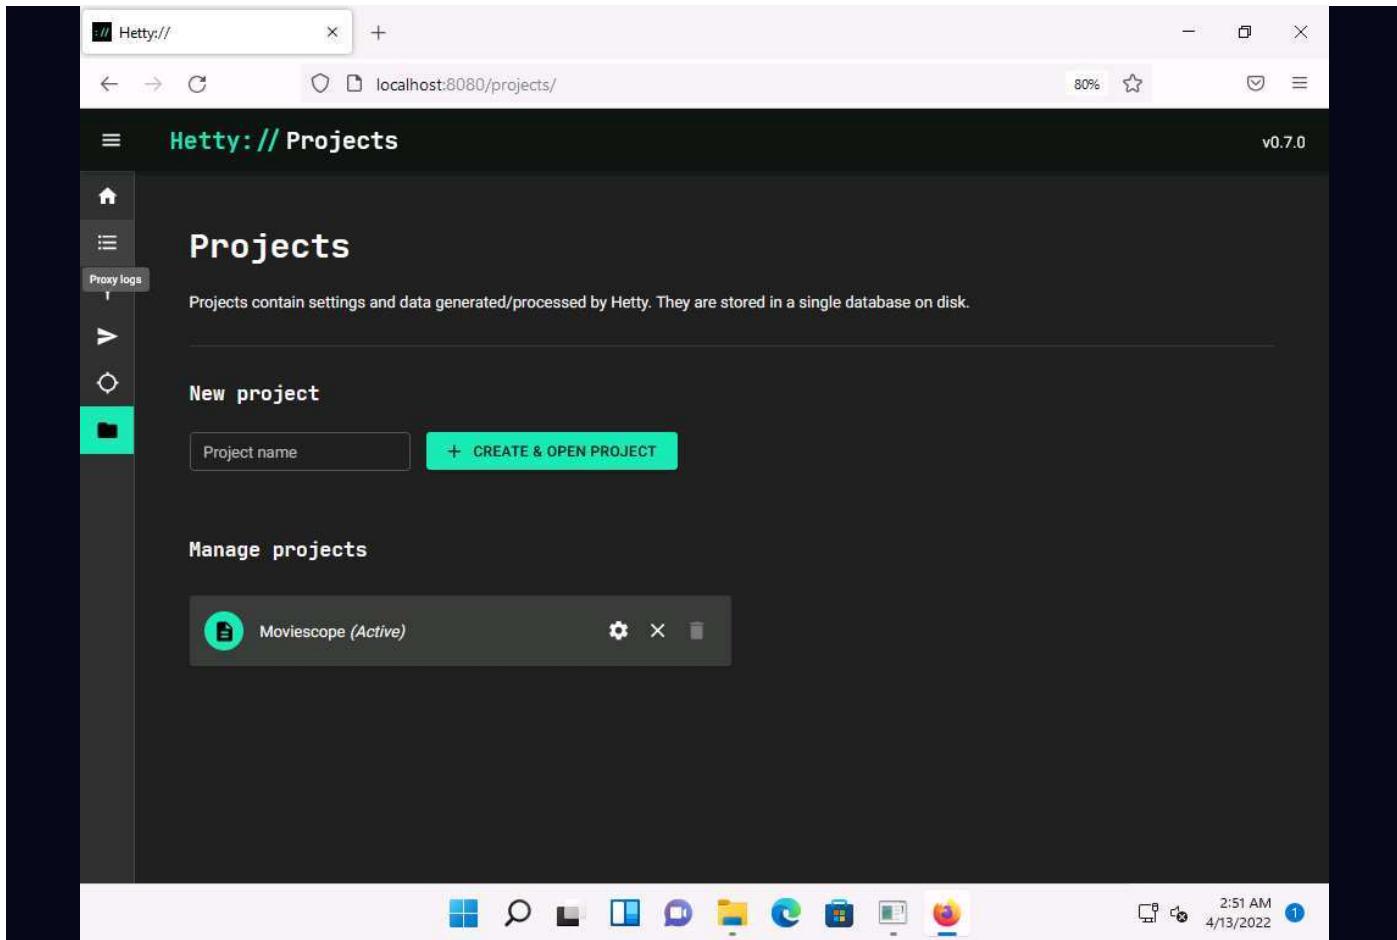

9. You can observe that a new project name **Moviescope** has been created under **Manage projects** section with a status as **Active**.

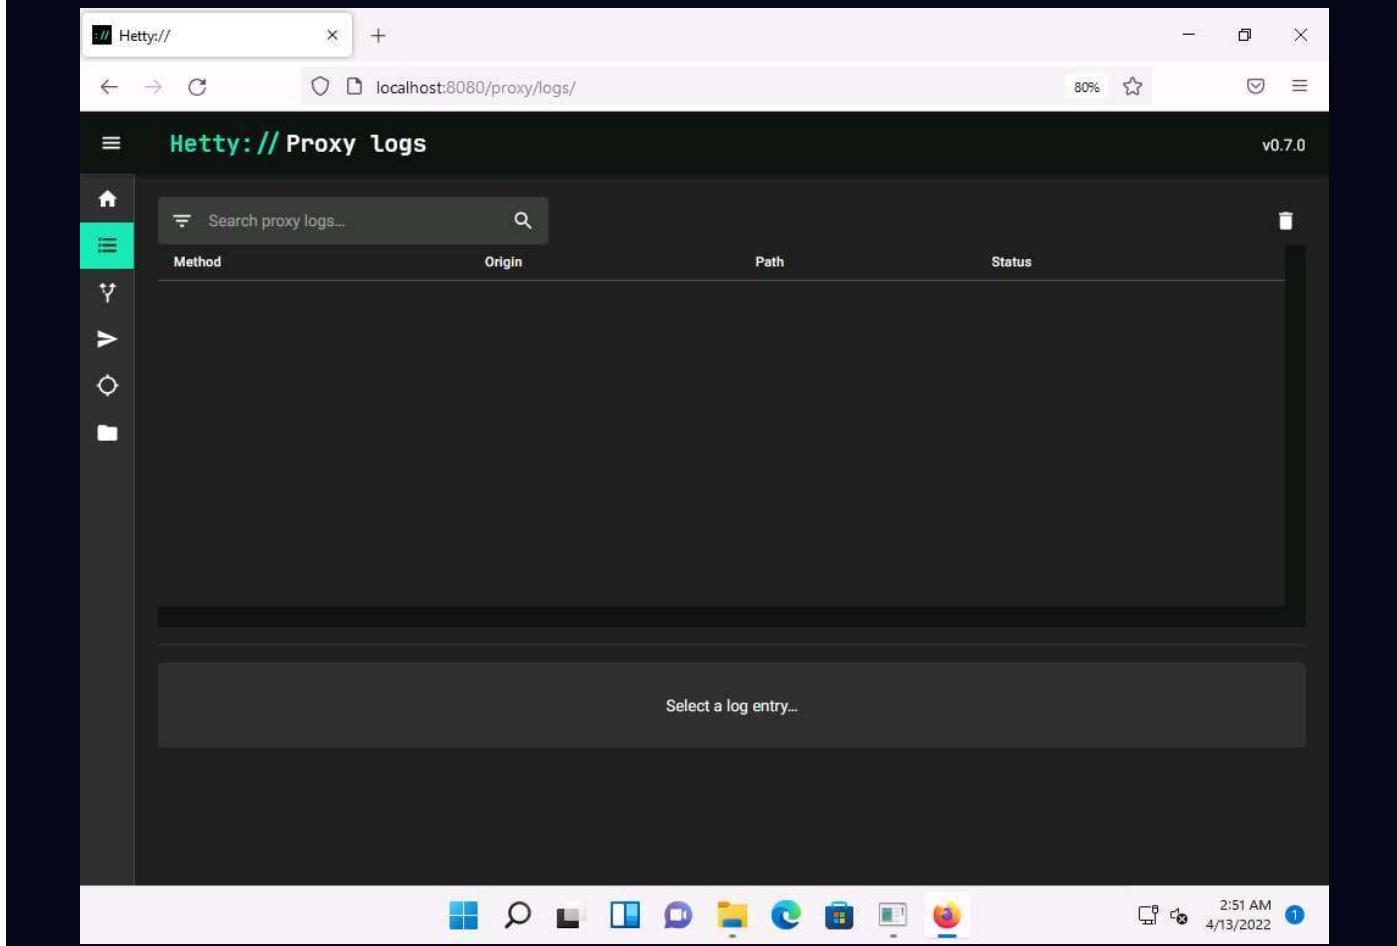

10. Click **Proxy logs** icon (☰) from the left-pane.

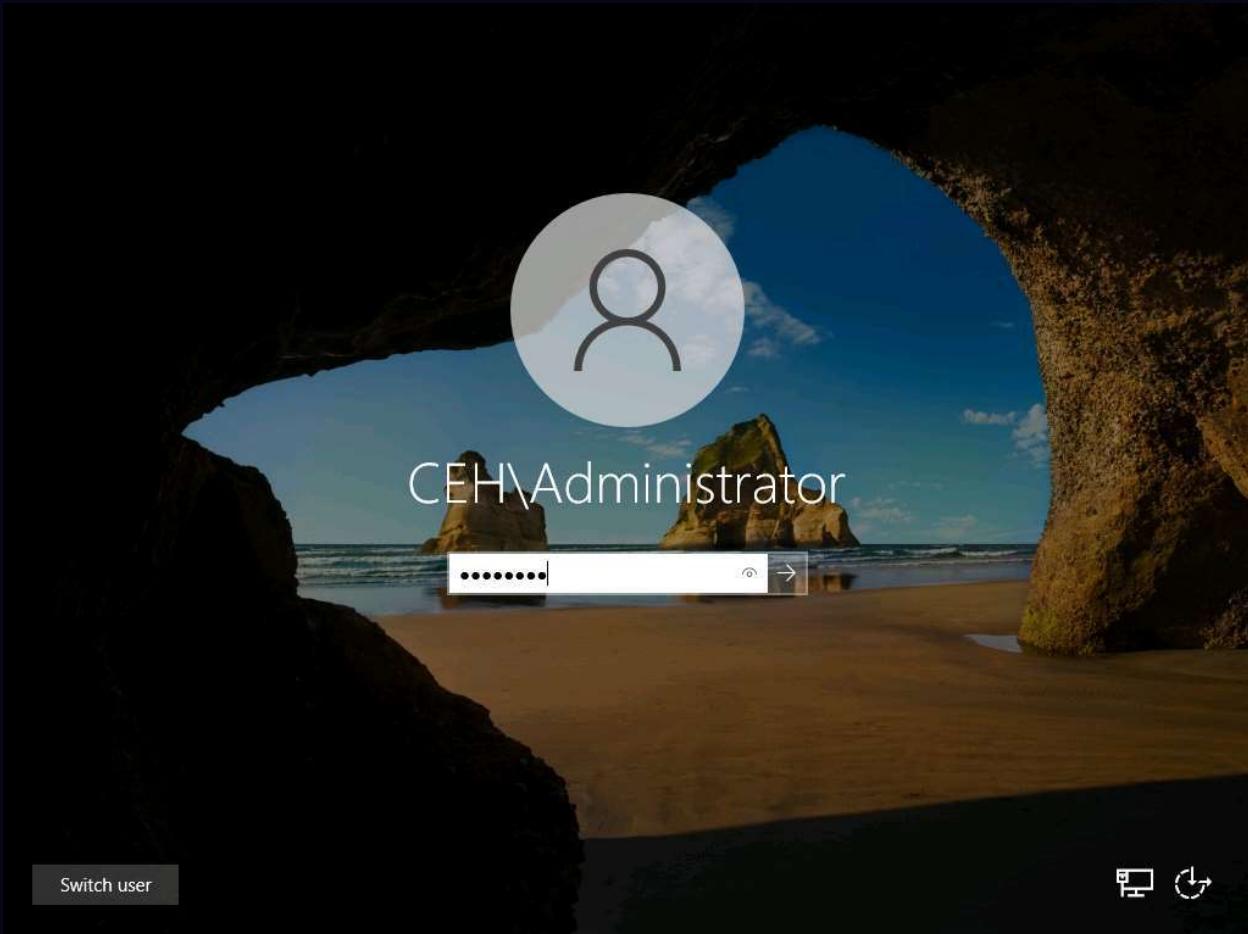

11. A **Proxy logs** page appears, as shown in the screenshot.

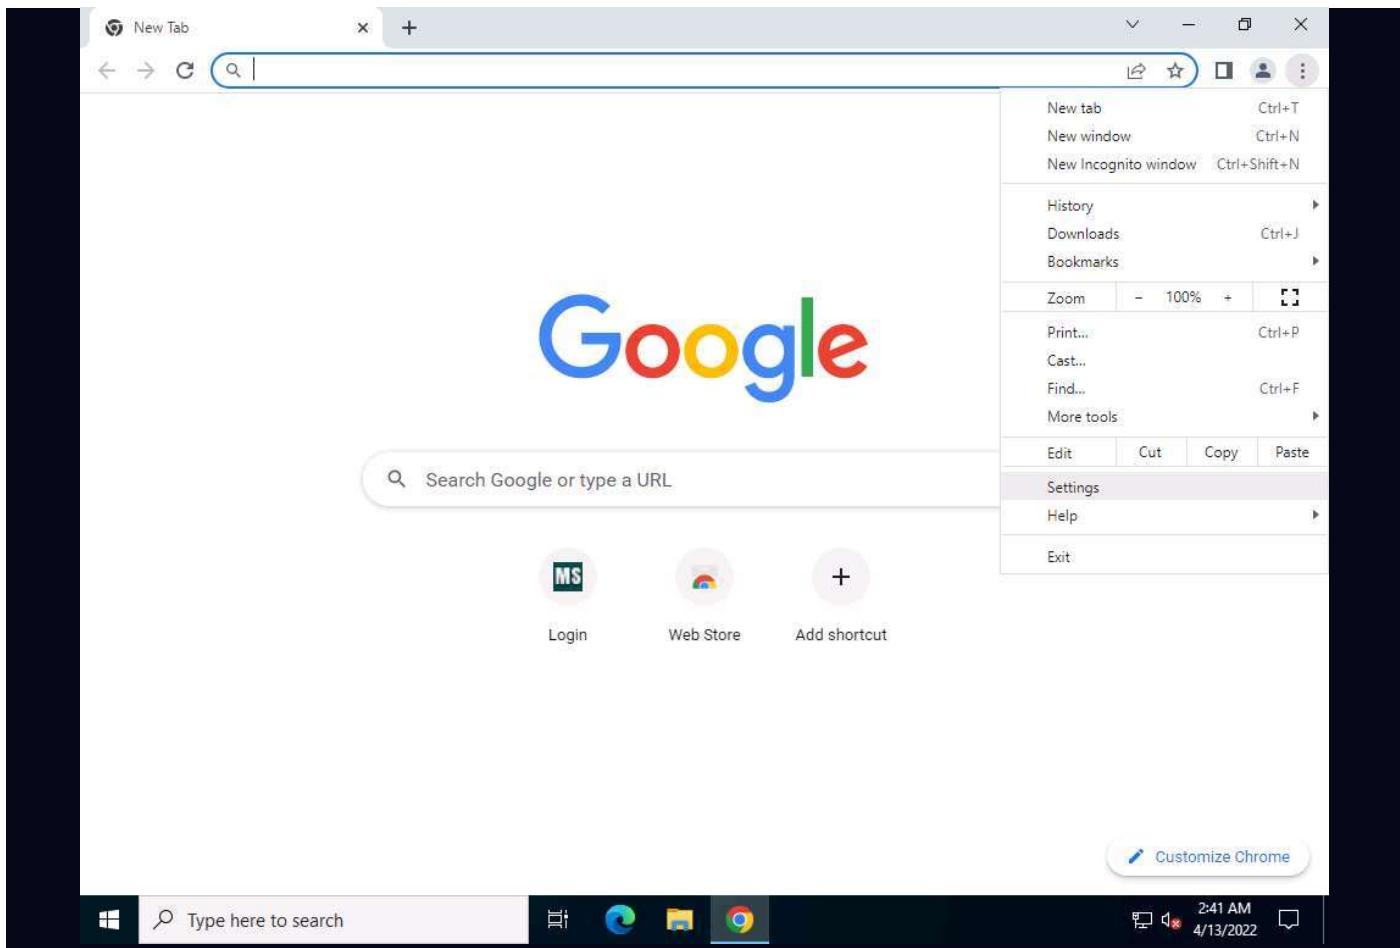

12. Now, click **CEHv12 Windows Server 2022** to switch to the **Windows Server 2022** machine. Click **Ctrl+Alt+Del** to activate the machine, by default, **CEH\Administrator** account is selected, type **Pa\$\$w0rd** in the Password field and press **Enter**.

Note: Networks screen appears, click **Yes** to allow your PC to be discoverable by other PCs and devices on the network.

13. Open **Google Chrome** web browser, click the **Customize and control Google Chrome** icon, and select **Settings** from the context menu.

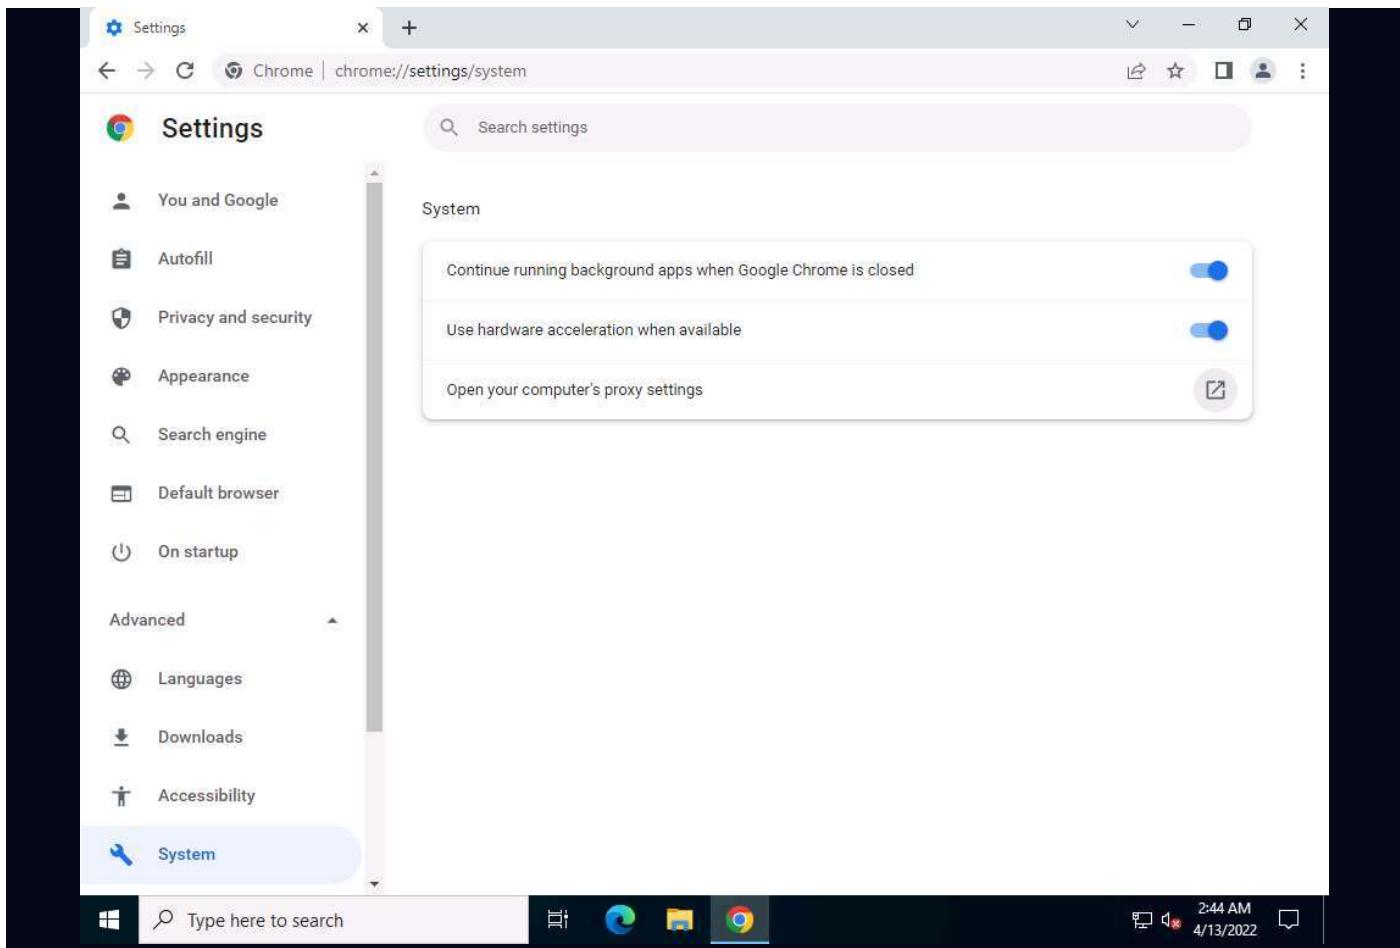

14. On the **Settings** page, expand **Advanced** settings and click **System** in the left-pane.

A screenshot of the Chrome Settings page. The left sidebar shows various categories: Appearance, Search engine, Default browser, On startup, Advanced (with sub-options Languages, Downloads, Accessibility), System (which is currently selected and highlighted with a red oval), and Reset and clean up. The main content area features a "You and Google" section with an illustration of a laptop, smartphone, and tablet connected by lines. It includes sections for "Get Google smarts in Chrome" (Sync and personalize Chrome across your devices), "Sync and Google services", "Customize your Chrome profile", and "Import bookmarks and settings". A "Turn on sync..." button is visible. The address bar at the top shows "chrome://settings".

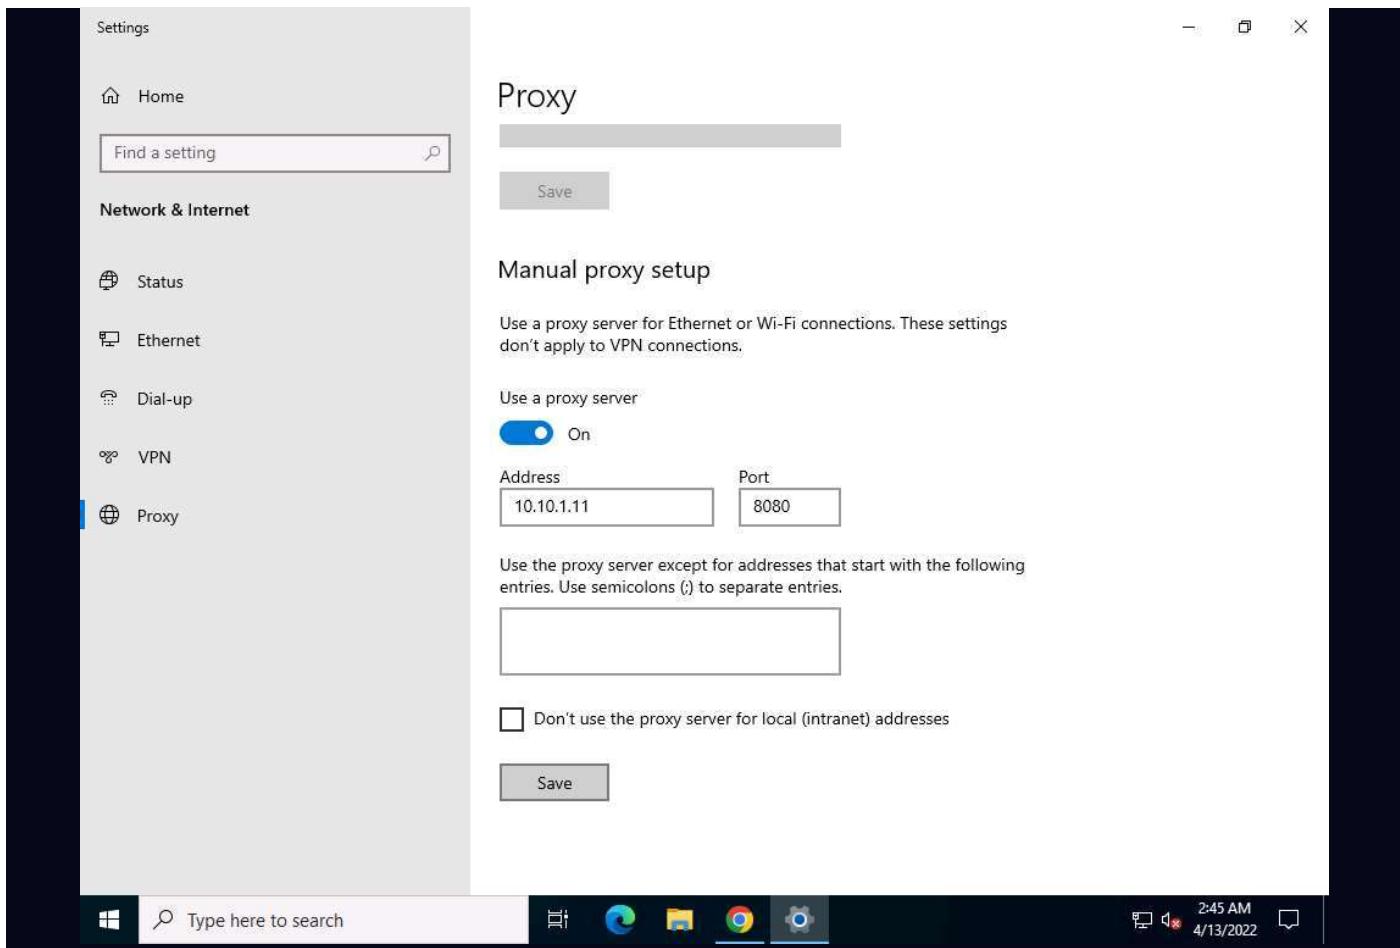

15. Scroll down to the **System** section and click **Open your computer's proxy settings** to configure a proxy.

16. A **Settings** window appears, with the **Proxy** settings in the right pane.

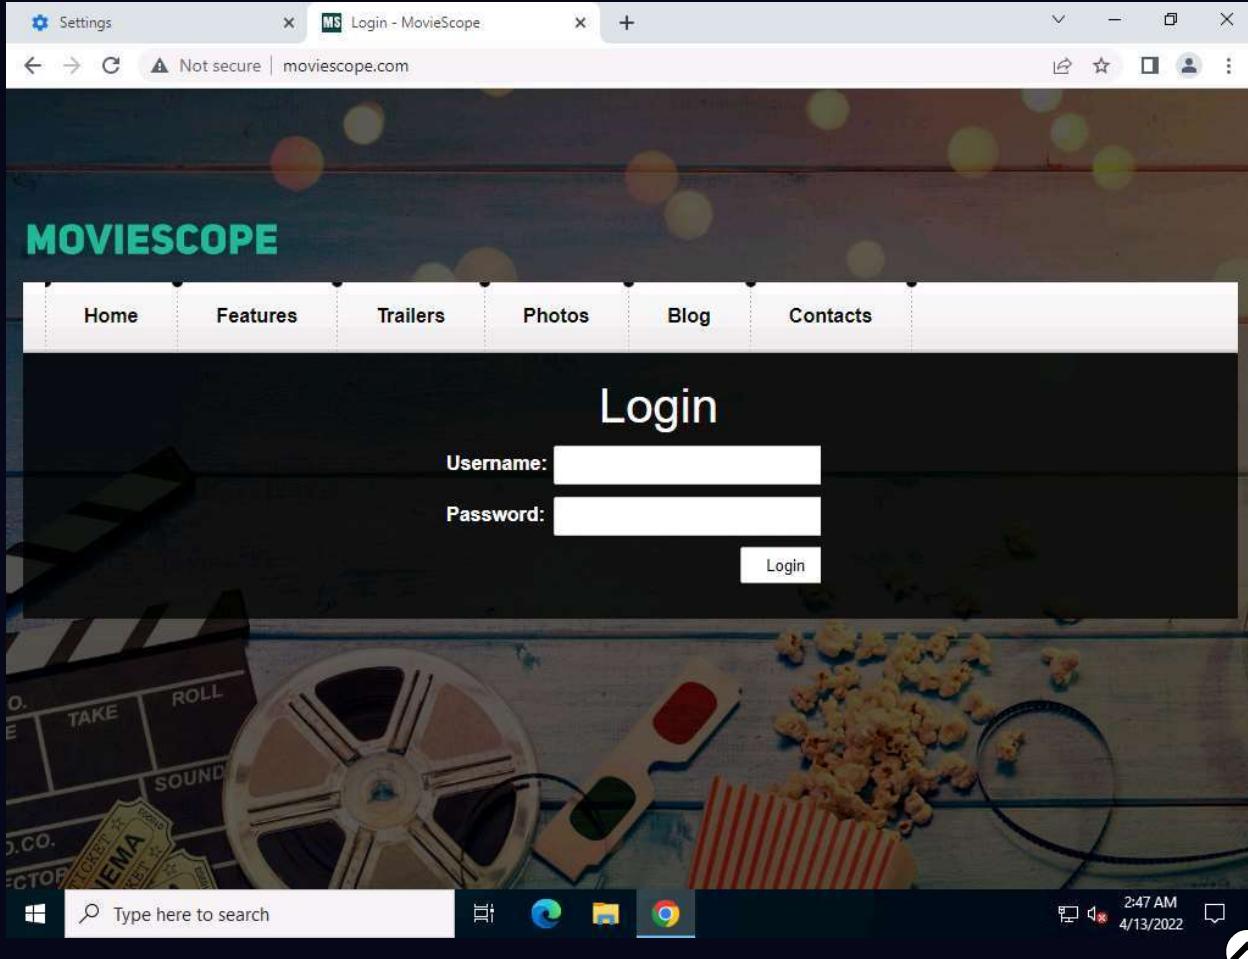

17. In the **Manual proxy setup** section, make the following changes:

- o Under the **Use a proxy server** option, click the **Off** button to switch it **On**.
- o In the **Address** field, type **10.10.1.11** (the IP address of the attacker's machine, here, **Windows 11**).
- o In the **Port** field, type **8080**.
- o Click **Save**.

18. After saving, close the **Settings** and browser windows. You have now configured the proxy settings of the victim's machine.

19. Now, in the browser window open a new tab, in the address bar, type <http://www.moviescope.com> and press **Enter**.

20. Click **CEHv12 Windows 11** to switch to the **Windows 11** machine.

21. You can observe that the logs are captured in the **Proxy logs** page. Here, we are focusing on logs associated with moviescope.com website.

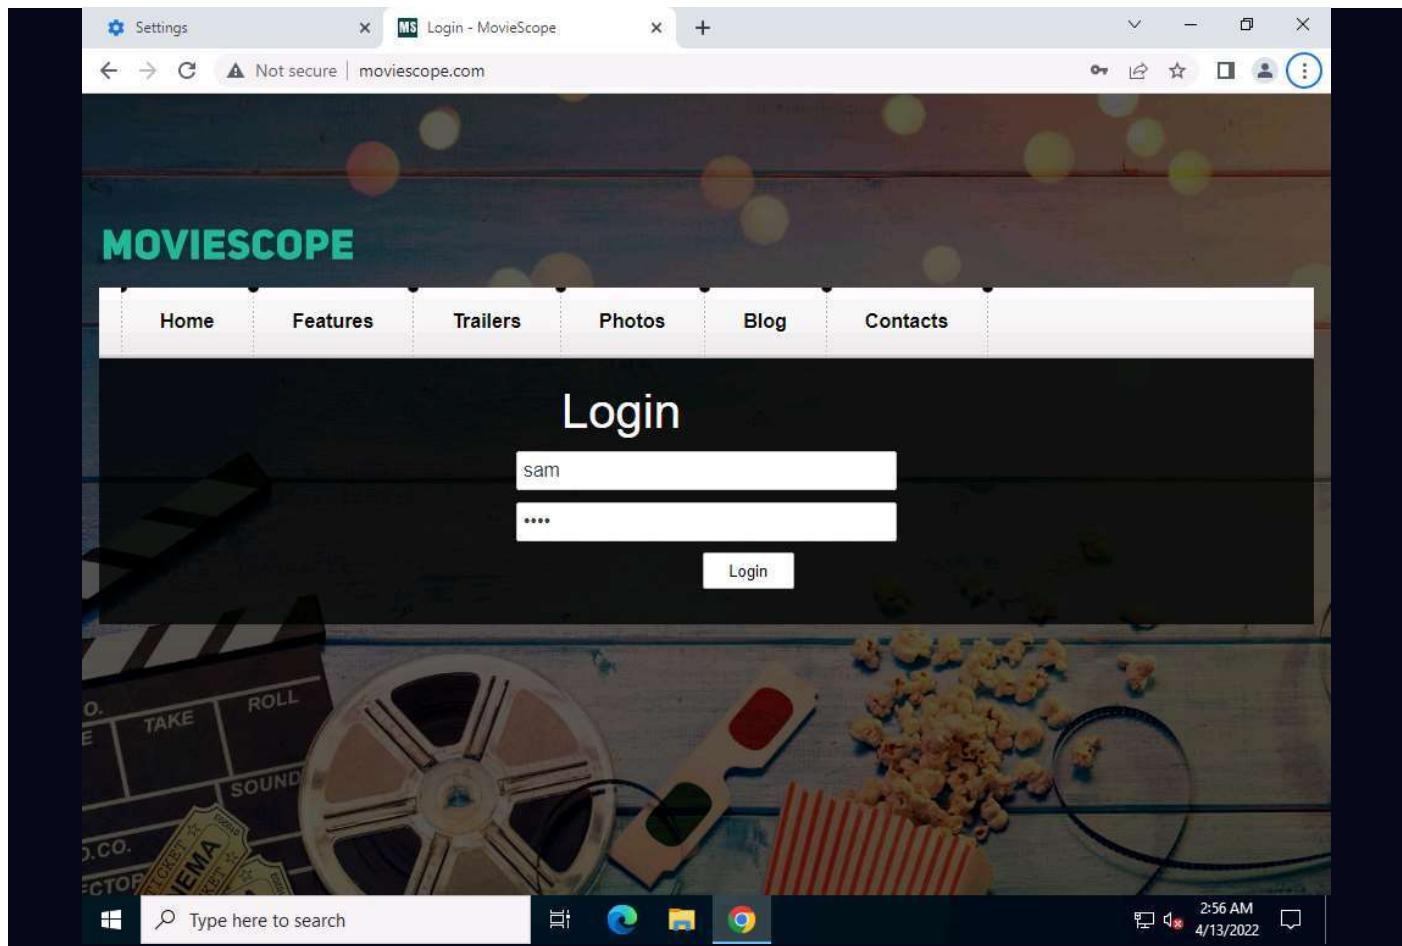

The screenshot shows the Hetty:// Proxy logs interface. The title bar says "Hetty:// Proxy logs" and "v0.7.0". The main area displays a table of log entries:

Method	Origin	Path	Status
GET	http://fonts.googleapis.com	/css?family=PT+Sans	404 Not Found

Below the table, a message says "Select a log entry...". At the bottom, there is a taskbar with icons for File Explorer, Task View, Start, Taskbar settings, and a clock showing 2:48 AM, 4/13/2022.

22. Click **CEHv12 Windows Server 2022** to switch back to the **Windows Server 2022** machine.

23. In the **MovieScope** website, login as a victim with credentials as **sam/test**.

24. Now, click **CEhv12 Windows 11** to switch to the **Windows 11** machine.

25. In the **Proxy logs** page, scroll-down to check more logs on moviescope website. Check for **POST** log captured for the target website.

Method	Origin	Path	Status
GET	http://fonts.googleapis.com	/css?family=PT+Sans	404 Not Found
GET	http://www.moviescope.com	/index.aspx	200 OK
POST	http://www.moviescope.com	/	302 Found
GET	http://fonts.googleapis.com	/css?family=PT+Sans	404 Not Found
GET	http://www.moviescope.com	/	200 OK

POST /

REQUEST

Query Params Headers (12) Body (324 bytes)

Key Value

Body (128 bytes) Headers (9) HTTP/1.1 302 Found RESPONSE

```
1 <html><head><title>Object moved</title></head><body>
2 <h2>Object moved to <a href="/index.aspx">here</a></h2>
3 </body></html>
```

26. Select the **POST request** and in the lower section of the page, select **Body** tab under **POST** section.

27. Under the **Body** tab, you can observe the captured user credentials, as shown in the screenshot.

The screenshot shows the Hetty:// Proxy logs interface. At the top, there's a search bar labeled "Search proxy logs...". Below it, a table lists proxy logs with columns for Method, Origin, Path, and Status. A "POST /" entry is selected, highlighted with a red border. In the REQUEST section, the "Body (324 bytes)" tab is selected, also highlighted with a red border. The body content is displayed as:

```
<html><head><title>Object moved</title></head><body><h2>Object moved to <a href="/index.aspx">here</a></h2></body></html>
```

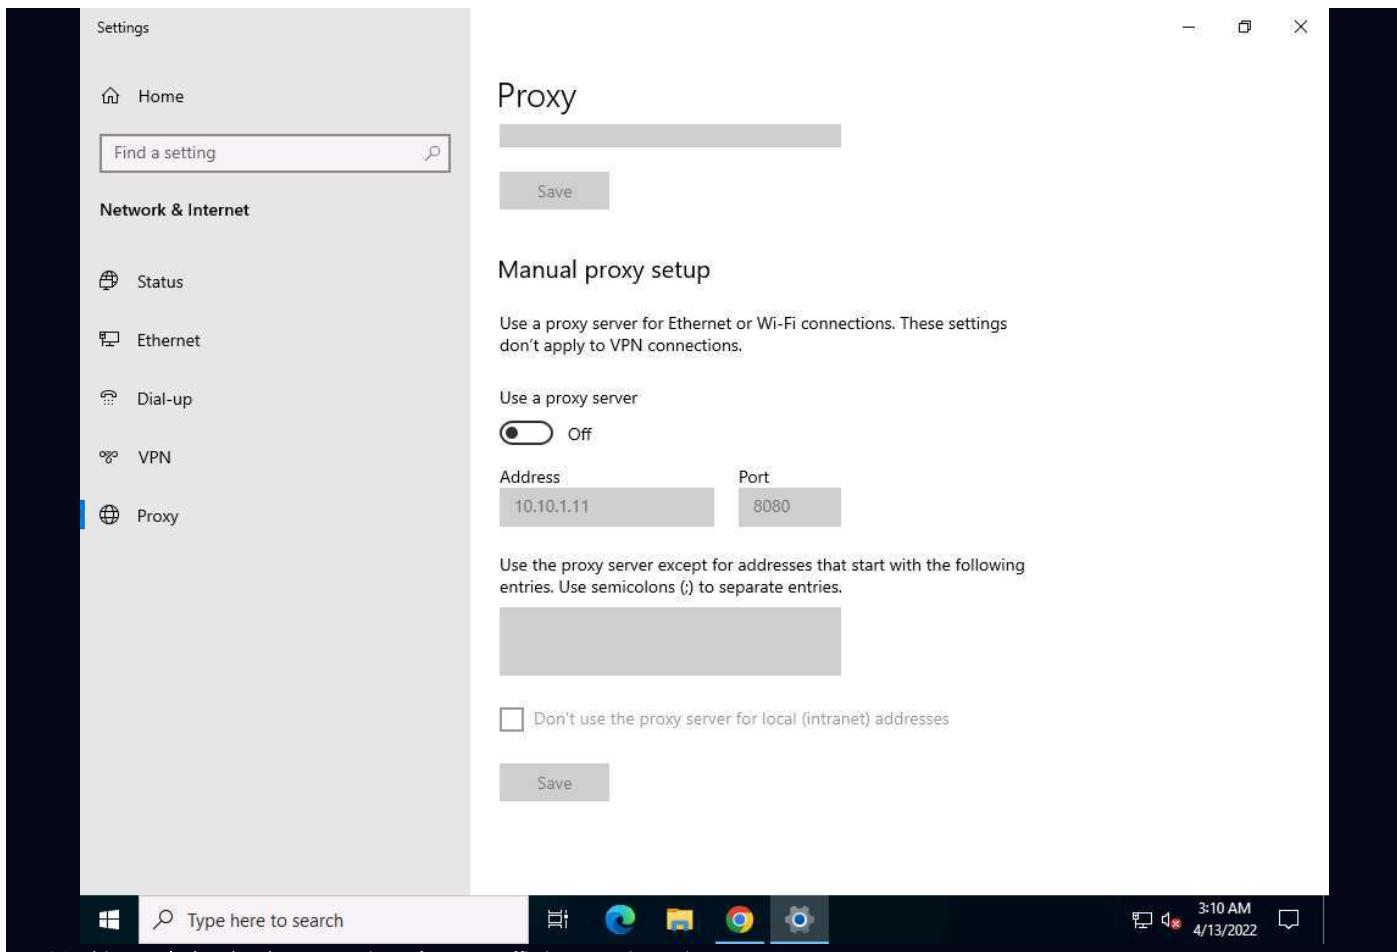

On the right side, the RESPONSE section shows the status as "HTTP/1.1 302 Found". The bottom of the window shows a taskbar with various icons and the date/time "4/13/2022 3:01 AM".

28. The captured credentials can be used to log in to the target user's account and obtain further sensitive information.

29. Now, we shall change the proxy settings back to the default settings. To do so, click **CEHv12 Windows Server 2022** to switch back to the **Windows Server 2022** machine and perform **Steps 13-16** again.

Note: If you are logged out of the **Windows Server 2022** machine, click **Ctrl+Alt+Del**, then login into **CEH\Administrator** user profile using **Pa\$\$w0rd** as password.

30. In the **Settings** window, under the **Manual proxy setup** section in the right pane, click the **On** button to toggle it back to **Off**, as shown in the screenshot.

31. This concludes the demonstration of HTTP traffic interception using Hetty.

32. Close all open windows and document all the acquired information.

Lab 2: Detect Session Hijacking

Lab Scenario

Session hijacking is very dangerous; it places the victim at risk of identity theft, fraud, and loss of sensitive information. All networks that use TCP/IP are vulnerable to different types of hijacking attacks. Moreover, these kinds of attacks are very difficult to detect, and often go unnoticed unless the attacker causes severe damage. However, following best practices can protect against session hijacking attacks.

As a professional ethical hacker or penetration tester, it is very important that you have the required knowledge to detect session hijacking attacks and protect your organization's system against them. Fortunately, there are various tools available that can help you to detect session hijacking attacks such as packet sniffers, IDSs, and SIEMs.

Lab Objectives

- Detect session hijacking using Wireshark

Overview of Detecting Session Hijacking

There are two primary methods that can be used to detect session hijacking:

- **Manual Method:** Involves using packet sniffing software such as Wireshark and SteelCentral Packet Analyzer to monitor session hijacking attacks; the packet sniffer captures packets being transferred across the network, which are then analyzed using various filtering tools
- **Automatic Method:** Involves using Intrusion Detection Systems (IDS) and Intrusion Prevention Systems (IPS) to monitor incoming network traffic; if a packet matches any of the attack signatures in the internal database, the IDS generates an alert, and the IPS blocks the traffic from entering the database

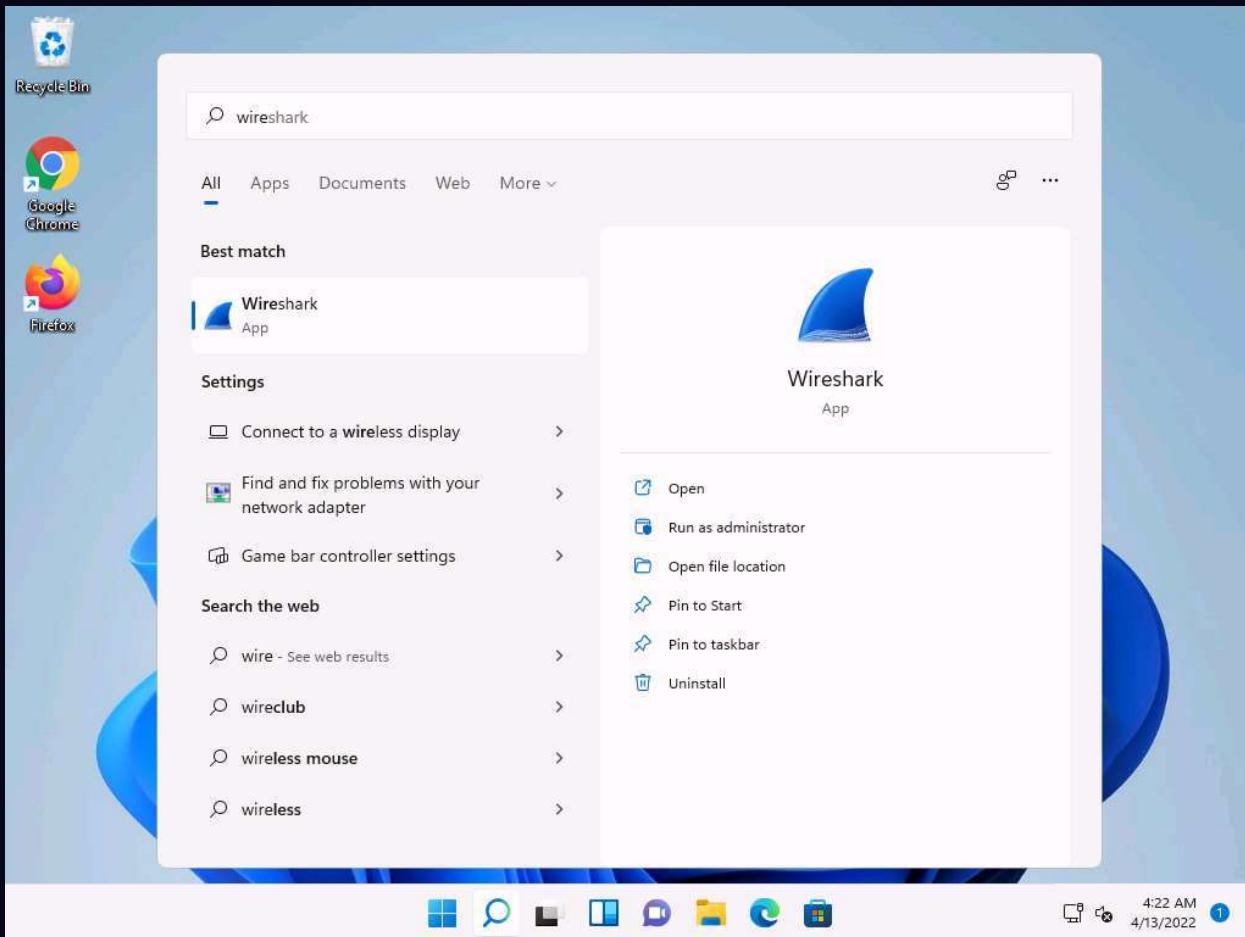

Task 1: Detect Session Hijacking using Wireshark

Wireshark allows you to capture and interactively browse the traffic running on a network. The tool uses WinPcap to capture packets, and so is only able to capture packets on networks that are supported by WinPcap. It captures live network traffic from Ethernet, IEEE 802.11, PPP/HDLC, ATM, Bluetooth, USB, Token Ring, Frame Relay, and FDDI networks. Security professionals can use Wireshark to monitor and detect session hijacking attempts.

Here, we will use the Wireshark tool to detect session hijacking attacks manually on the target system.

Note: We will use the **Parrot Security (10.10.1.13)** machine to carry out a session hijacking attack on the **Windows 11 (10.10.1.11)** machine.

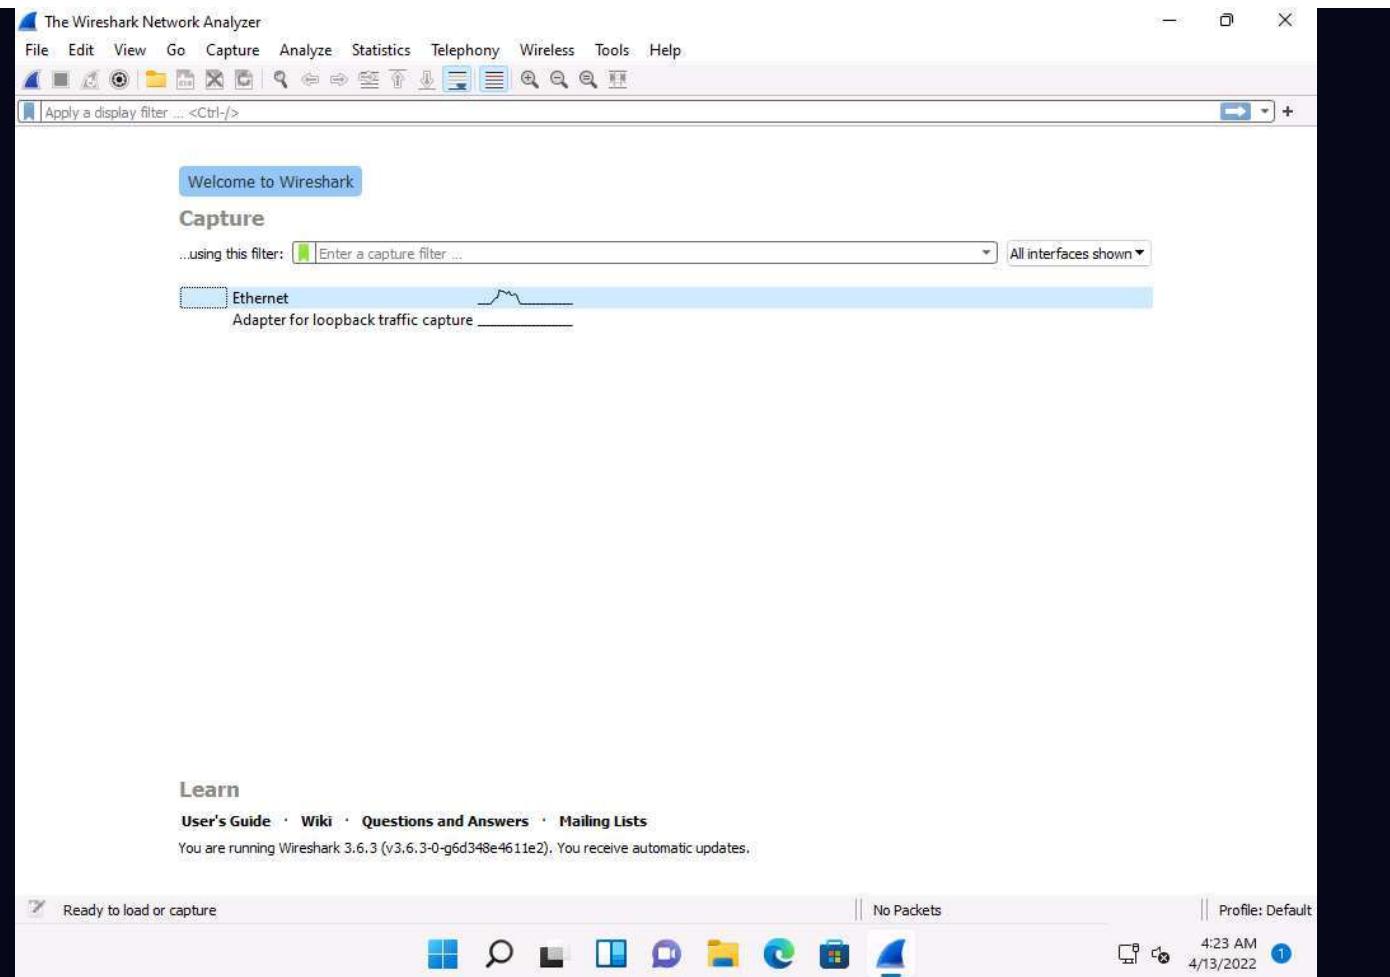

1. Click **CEHv12 Windows 11** to switch to the **Windows 11** machine.
2. Click **Search** icon () on the **Desktop**. Type **wire** in the search field, the **Wireshark** appears in the result, click **Open** to launch it.

3. The **Wireshark Network Analyzer** window opens. Double-click the primary network interface (in this case, **Ethernet**) to start capturing network traffic.

Note: If a **Software Update** pop-up appears click on **Remind me later**.

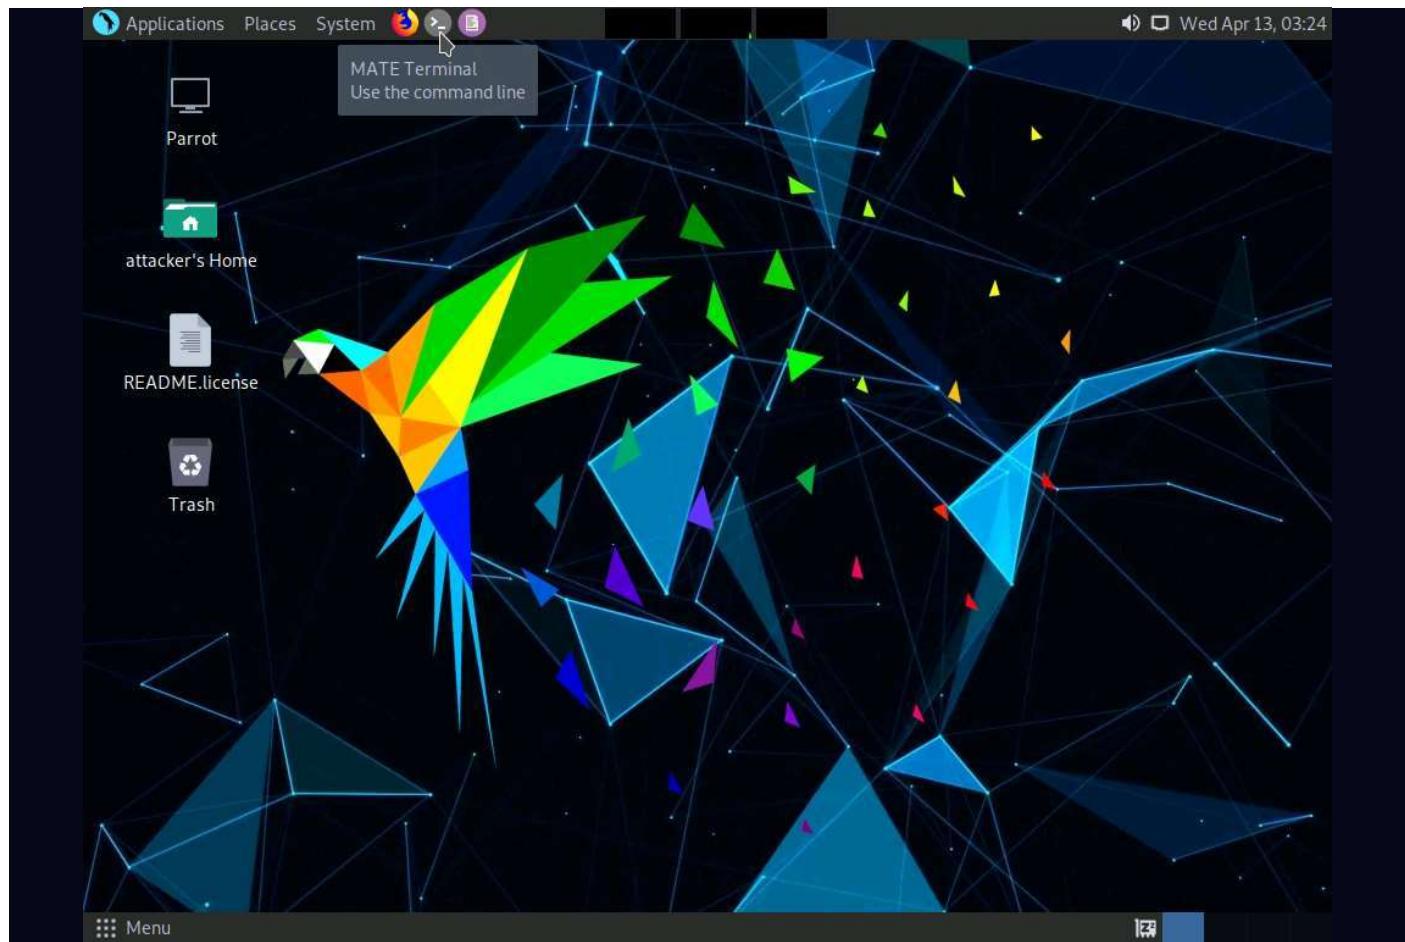

4. **Wireshark** starts capturing network traffic. Leave it running.

5. Now, we shall launch a session hijacking attack on the target machine (**Windows 11**) using **bettercap**.

Note: To do so, you may either follow Steps **8-15** below, or refer to Task 2 (Intercept HTTP Traffic using bettercap) in Lab 1.

6. Click **CEHv12 Parrot Security** to switch to the **Parrot Security** machine.

7. Click the **MATE Terminal** icon at the top of the **Desktop** window to open a **Terminal** window.

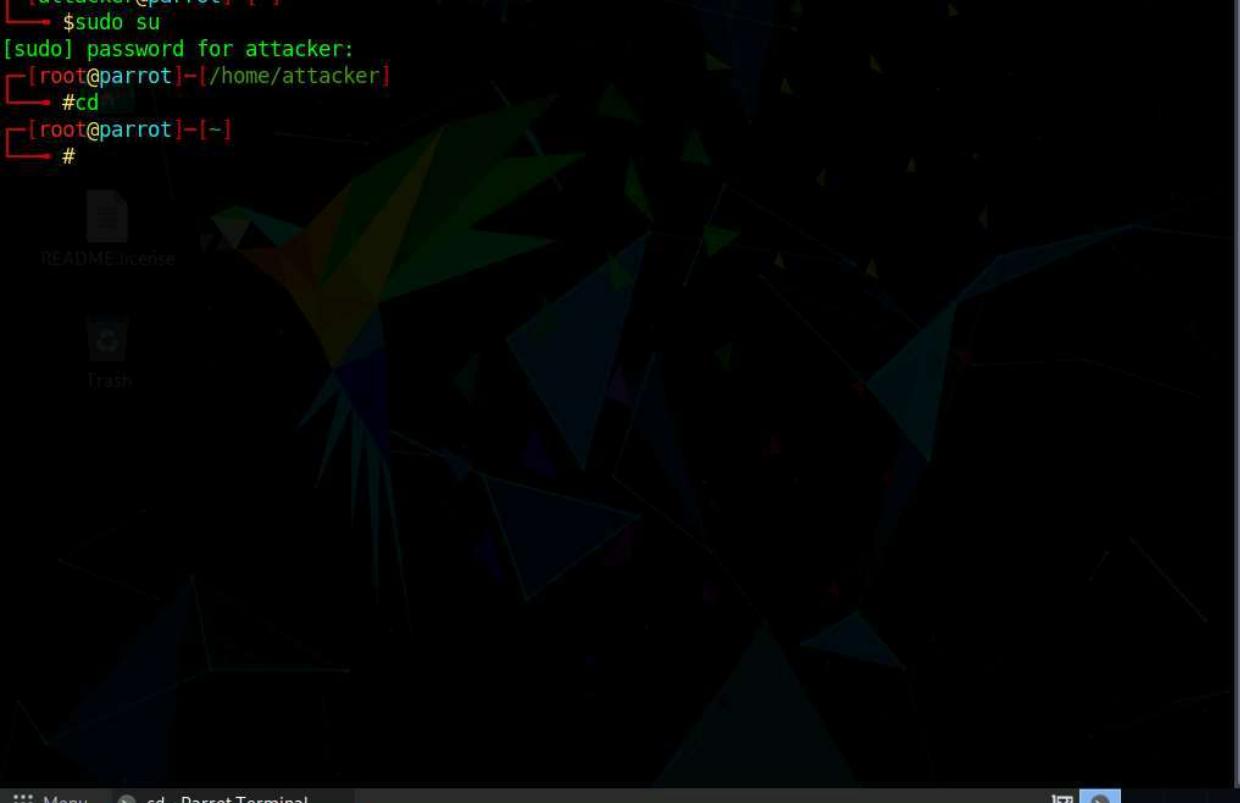

8. A **Parrot Terminal** window appears. In the terminal window, type **sudo su** and press **Enter** to run the programs as a root user.

9. In the **[sudo] password for attacker** field, type **toor** as a password and press **Enter**.

Note: The password that you type will not be visible.

10. Now, type **cd** and press **Enter** to jump to the root directory.

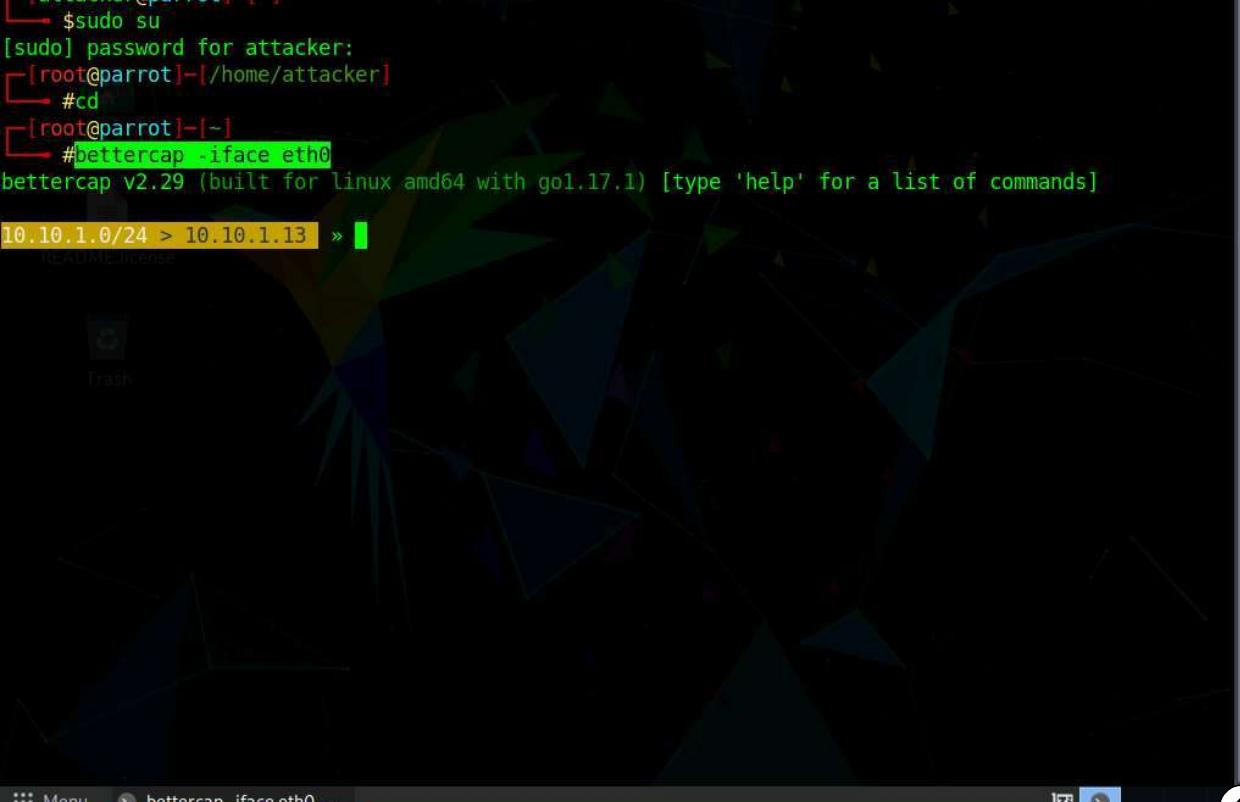

Applications Places System cd - Parrot Terminal

File Edit View Search Terminal Help

```
[attacker@parrot] -[~]
└─$ sudo su
[sudo] password for attacker:
[root@parrot] -[/home/attacker]
└─#cd
[root@parrot] -[~]
└─#
```

11. In the terminal window, type **bettercap -iface eth0** and press **Enter** to set the network interface.

Note: **-iface**: specifies the interface to bind to (here, **eth0**).

Applications Places System bettercap -iface eth0 - Parrot Terminal

File Edit View Search Terminal Help

```
[attacker@parrot] -[~]
└─$ sudo su
[sudo] password for attacker:
[root@parrot] -[/home/attacker]
└─#cd
[root@parrot] -[~]
└─#bettercap -iface eth0
bettercap v2.29 (built for linux amd64 with go1.17.1) [type 'help' for a list of commands]
10.10.1.0/24 > 10.10.1.13 »
```

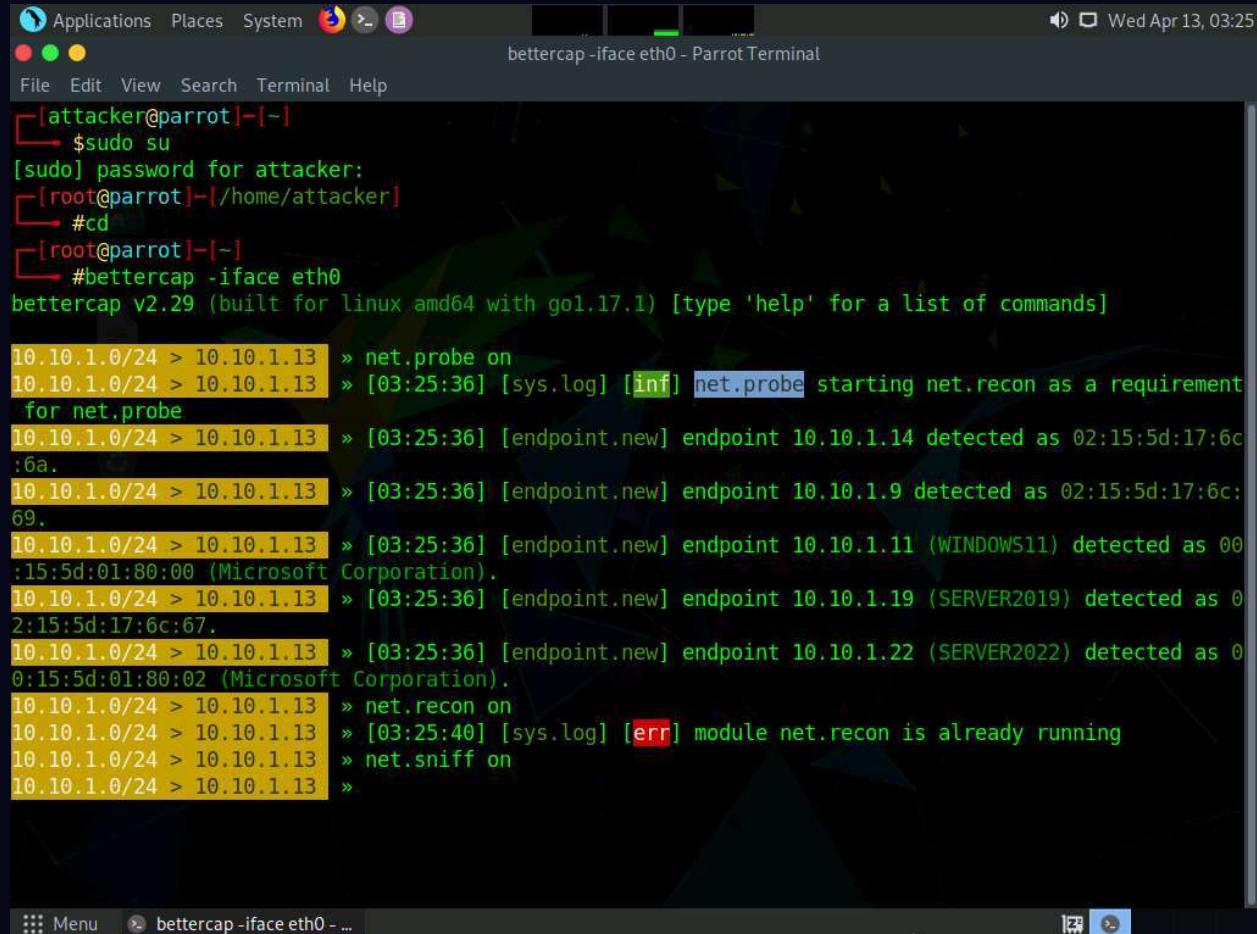

12. Type **net.probe on** and press **Enter**. This module will send different types of probe packets to each IP in the current subnet for the **net.recon** module to detect them.

13. Type **net.recon on** and press **Enter**. This module is responsible for periodically reading the system ARP table to detect new hosts on the network.

Note: The net.recon module displays the detected active IP addresses in the network. In real-time, this module will start sniffing network packets.

14. Type **net.sniff on** and press **Enter**. This module is responsible for performing sniffing on the network.

15. You can observe that bettercap starts sniffing network traffic on different machines in the network, as shown in the screenshot.

```
[attacker@parrot] -[~]
└─$ sudo su
[sudo] password for attacker:
[root@parrot] -[~/home/attacker]
└─# cd
[root@parrot] -[~]
└─# bettercap -iface eth0
bettercap v2.29 (built for linux amd64 with go1.17.1) [type 'help' for a list of commands]

10.10.1.0/24 > 10.10.1.13 » net.probe on
10.10.1.0/24 > 10.10.1.13 » [03:25:36] [sys.log] [inf] net.probe starting net.recon as a requirement for net.probe
10.10.1.0/24 > 10.10.1.13 » [03:25:36] [endpoint.new] endpoint 10.10.1.14 detected as 02:15:5d:17:6c:6a.
10.10.1.0/24 > 10.10.1.13 » [03:25:36] [endpoint.new] endpoint 10.10.1.9 detected as 02:15:5d:17:6c:69.
10.10.1.0/24 > 10.10.1.13 » [03:25:36] [endpoint.new] endpoint 10.10.1.11 (WINDOWS11) detected as 00:15:5d:01:80:00 (Microsoft Corporation).
10.10.1.0/24 > 10.10.1.13 » [03:25:36] [endpoint.new] endpoint 10.10.1.19 (SERVER2019) detected as 02:15:5d:17:6c:67.
10.10.1.0/24 > 10.10.1.13 » [03:25:36] [endpoint.new] endpoint 10.10.1.22 (SERVER2022) detected as 00:15:5d:01:80:02 (Microsoft Corporation).
10.10.1.0/24 > 10.10.1.13 » net.recon on
10.10.1.0/24 > 10.10.1.13 » [03:25:40] [sys.log] [err] module net.recon is already running
10.10.1.0/24 > 10.10.1.13 » net.sniff on
10.10.1.0/24 > 10.10.1.13 »
```

16. Click **CEHv12 Windows 11** to switch back to the **Windows 11** machine and observe the huge number of **ARP packets** captured by the **Wireshark**, as shown in the screenshot.

Note: bettercap sends several ARP broadcast requests to the hosts (or potentially active hosts). A high number of ARP requests indicates that the system at **10.10.1.13** (the attacker's system in this task) is acting as a client for all the IP addresses in the subnet, which means that all the packets from the victim node (in this case, **10.10.1.11**) will first go to the host system (**10.10.1.13**), and then the gateway. Similarly, any packet destined for the victim node is first forwarded from the gateway to the host system, and then from the host system to the victim node.
